Credit Confidence: The Impact of Disclosure Quality and Audit Quality on Bank Ratings in Emerging Economies

Abstract

Purpose - This study aims to examine how Banks' credit ratings can be driven by the quality of the disclosed financial and non-financial information in emerging economies.

Design/methodology/approach - Using a sample of 1590 bank-year observations of 29 Islamic and 77 conventional banks across 17 MENA countries from 2006 to 2020, we conducted a random-effects regression model that is supported by various methods, including 2SLS and GMM models, to overcome the potential incidence of endogeneity concerns.

Findings - We found that the quality of voluntary disclosure positively influences the credit rating of Islamic and conventional banks. Although the spread and usefulness of disclosed information are positively associated with banks' ratings, the quantity dimension is not. Audit quality also significantly influences Islamic banks' credit ratings compared to their traditional counterparts.

Originality/value - Our paper contributes to the existing literature by investigating the effect of the quality of voluntary disclosures on credit ratings along three dimensions: quantity, spread, and usefulness of the information. Further, our research contributes to the international accounting literature by investigating the effect of audit quality on the credit ratings of both conventional and Islamic banks in a cross-country setting.

Practical implications - Our evidence offers practical implications for regulators and standards setters in emerging economies to develop more effective disclosure regimes to enhance the impact of the quality of banks' voluntary disclosures on their credit ratings.

Keywords: Quality of voluntary disclosure, Audit quality, Credit rating, Islamic and conventional banks.

1. Introduction

The significance of firms' credit ratings stems from their influence on the valuations of stocks, bonds and the contractual and regulatory costs linked to variations in credit ratings (Akorsu, 2023; Attig et al., 2021; Cao et al., 2024; Delis et al., 2021; Kisgen, 2006; Vink et al., 2021; Wojewodzki et al., 2020). Thus, it has fuelled extensive research on the drivers of credit rating. (Adams et al., 2003; Al-Gasaymeh, 2016; Gray et al., 2006; Guedes & Opler, 1996; Jiang & Packer, 2019; Mutize & Nkhalamba, 2020; Nguyen et al., 2020a; Opler et al., 1999; Oskonbaeva, 2020; Teixeira et al., 2018). For instance, a recent body of literature indicates that corporations are keener on credit ratings when it comes to financial decisions (Cho et al., 2020; Slapnik and Lončarski, 2023), leases (Bendig et al., 2017; Lim et al., 2017), firms' financial reporting quality (Alissa et al., 2013; Chiang et al., 2023; Hill et al., 2019; Lee & Schantl, 2019; Liu et al., 2018; Zhang, 2020; Zhang, 2018), and corporate governance (Allaya et al., 2022; Ashbaugh-Skaife et al., 2006; Mali & Lim, 2016).

Previous studies in the Anglo-American environment suggest that managers disclose firm-level information to enhance their companies' credit ratings (Basu et al., 2022; DeBoskey & Gillett, 2013; Gillette et al., 2020; He, 2018; Heflin et al., 2011; Oh & Park, 2017). For instance, Basu et al. (2022) document that variations influence firms' voluntary disclosure in credit ratings; these firms provide more voluntary disclosure following downgrading and less disclosure, resulting in upgrades due to the regulatory role of credit ratings. At the same time, He (2018) claimed that managers might release good news selectively to ensure that rating agencies are unlikely to verify the reliability of the disclosed information. This view suggests that managers might opportunistically use their voluntary disclosure as a mechanism through which they can enhance their companies' credit ratings. Hence, rating agencies should devote sufficient attention to the quality of voluntary disclosures as key determinants of firms' credit ratings. Accordingly, the first question we pose in this study is as follows. Is firms' voluntary disclosure quality associated with credit rating?

The current literature concerning the association between voluntary disclosures and credit ratings offers inconsistent findings (Basu et al., 2022; Botosan, 1997; Francis et al., 2008; Bonsall & Miller, 2017; He, 2018). For example, companies with higher credit ratings are less likely to reveal favorable financial information (DeBoskey

1
2
3 & Gillett, 2013; Gillette et al., 2020; He, 2018; Heflin et al., 2011), whereas Elamer
4 (2017) identified a positive correlation between banks' risk disclosure and credit
5 ratings, underscoring the significance of risk disclosure in mitigating information
6 asymmetry. Grassa et al. (2020) indicated that banks with better credit ratings exhibit
7 more comprehensive risk disclosures. Nevertheless, previous studies mainly
8 concentrated on the quantity (level) of disclosures. Therefore, unlike previous studies,
9 our research contributes to the existing literature by investigating the influence of the
10 *quality* of voluntary disclosures on credit ratings.

11
12
13
14
15
16
17
18 Additionally, previous studies indicate that credit ratings are influenced not just
19 by voluntary disclosures but also by audit quality, which serves as a proxy for required
20 disclosures (Cha et al., 2016; Lim & Mali, 2020; Moalla & Baili, 2019; Vanhaverbeke
21 et al., 2024). Research on the impact of audit quality across different countries is
22 scarce, mostly concentrating on Korea (Cha et al., 2016) and Tunisia (Moalla & Baili,
23 2019). This study investigates the influence of audit quality on banks' credit ratings in
24 various nations. Based on Wardhani (2019), we claim that audit quality improves the
25 reliability of voluntary disclosures, leading to our second research question: *Can audit*
26 *quality influence banks' credit ratings in emerging economies?*

32
33
34 Our motives for examining this relationship in the MENA region are as follows:
35 First, previous studies on the relationship between disclosure and bank credit rating
36 have not considered banks' cultural and religious environment. Unlike the Anglo-
37 Saxon environment, where formal institutions mainly influence firm-level decisions and
38 disclosure practices (García-Sánchez et al., 2016; Ghazwani et al., 2024; Gerged et
39 al., 2023; Salem et al., 2023; North, 1994), studies suggest that the religious
40 environment of MENA affects the quality of disclosed firm-level information
41 (Abdelsalam et al., 2021; Salem et al., 2023b), with a likelihood of differential effect on
42 the relationship between voluntary disclosure and bank credit rating. Secondly, despite
43 the influence of religious social norms on the region, Sarhan and Ntim (2019) reported
44 differences in voluntary disclosure across countries in the MENA region, suggesting
45 variation in the magnitude of their effect on firms' practices. Therefore, it is important
46 to examine the impact of disclosure on bank ratings in this region. Earlier studies in
47 the Anglo-Saxon environment considered only conventional banks (DeBoskey &
48 Gillett, 2013; Gillette et al., 2020; He, 2018; Heflin et al., 2011). Our study considered
49 both Islamic and conventional banks with headquarters in the region to reflect the

60

1
2
3 impact of the religious environment on their corporate practices. Finally, some studies
4 have emphasized that credit rating cannot only be determined by voluntary disclosure
5 quality and suggested the role of audit quality as a proxy for the quality of disclosures
6 (Lim & Mali, 2020; Lim et al., 2017; Moalla & Baili, 2019). Also, the literature suggests
7 that national culture (Diallo, 2021; Eltweri et al., 2021) and regulatory environment
8 (Zureigat, 2015) influence auditing practice in individual countries in the MENA region.
9 For instance, some countries, such as Saudi Arabia and Egypt, have international
10 standards of auditing based on IFRS, which may affect the quality of audits, unlike
11 those with a less comprehensive approach. The literature also documented evidence
12 of variation in the audit quality of firms in MENA as a result of differences in corporate
13 governance quality (Ben-Hassoun et al., 2018; R. Salem et al., 2021; Sarhan & Ntim,
14 2019) and limited transparency in the audit process (Sarhan & Ntim, 2019).

Against this backdrop, we examine the impact of voluntary disclosure and audit quality on bank credit rating using hand-gathered data spanning 1590 bank-year observations across 17 countries from the Middle East and North Africa (MENA) region between 2006 and 2020. We found that the quality of voluntary disclosure has a significant and positive impact on the credit rating of Islamic and conventional banks. The quantity dimension of disclosure has no impact on the credit rating; however, the spread and usefulness of disclosed information positively and significantly affect the bank rating. In addition, audit quality substantially influences the credit rating of Islamic banks compared with those of their competitors.

Our study contributes to the international accounting literature in several ways. *First*, prior studies have examined the impact of the extent (*level*) of disclosures on credit ratings (Elamer, 2017; Gillette et al., 2020; Grassa et al., 2020; He, 2018). Thus, our study extends the extant literature by examining the impact of the quality of voluntary disclosures on credit ratings, using three different dimensions, namely, *quantity*, *spread* and *usefulness* of the information. This thorough method acts as a strong indicator of disclosure quality, facilitating an in-depth examination of the patterns and characteristics of disclosure quality. *Second*, our study also contributes to the international accounting literature by examining the impact of audit quality on credit ratings of both Islamic and conventional banks in a cross-country context. Our empirical findings provide practical implications for the policymakers and managers in emerging countries' financial institutions, especially in the Middle East and North

1
2
3 Africa. *Finally*, we contribute to the existing literature by examining the collaborative
4 impact of voluntary disclosure and audit quality on bank credit ratings within the MENA
5 region, a context defined by the interaction of formal and informal institutions
6 (Abdelsalam et al., 2021; Satt & Iatridis, 2024). This dual influence establishes a
7 unique institutional context, influencing firm-level disclosure and governance
8 practices. By emphasizing this under-explored region, we offer novel insights into the
9 influence of institutional dynamics in MENA on banks' credit ratings, thereby filling a
10 significant gap in cross-country credit rating research.

17
18 The remainder of the article is structured as follows: The next section provides the
19 institutional background. Section 3 reviews prior studies that have explored the impact
20 of voluntary disclosure and audit quality on banks' credit ratings and develops the main
21 research hypotheses. Section 4 outlines the research methods, and Section 5 shows
22 the empirical results. Section 6 provides conclusions, implications, and limitations.
23
24
25

26 27 **2 Institutional background**

28
29 The institutional environment of MENA countries is unique and provides an interesting
30 setting for our study for several reasons. First, these Arab and Muslim-majority
31 countries share numerous cultural commonalities in variable degrees (Hofstede et al.,
32 2015). For instance, the prevalence of the Islamic religion in this region is linked to the
33 dominance of Islamic banks, as Bahrain, Saudi Arabia, and UAE are among the top 5
34 developed countries in terms of Islamic finance (ICD-Refinitiv Report, 2020). **Second,**
35 **the Western influence on MENA countries is profoundly ingrained in their legal,**
36 **educational, and economic frameworks, influenced by historical connections to**
37 **previous colonial powers (Salem et al., 2021).** Crucially, business cultures in these
38 countries are hugely influenced by either a British culture, such as in Saudi Arabia,
39 Egypt and Jordan or French heritage, e.g., in Morocco, Algeria and Tunisia, due to the
40 effect of colonization of these countries (See Akrouf & Othman, 2013; Gerged, 2018).
41 This means that conventional banks also prevail and perform significantly well in this
42 region (Kharrat et al., 2024; Mahdi & Abbes, 2018; Mateev et al., 2022). Therefore, we
43 argue that the banking sector of the MENA region, consisting of Islamic and
44 conventional banks, performs exceptionally well and has been a keen area of research
45 since the global financial crisis of 2008 (Mateev & Bachvarov, 2021). Third, the
46 business environment in MENA countries is dominated by state ownership, as most
47

MENA countries are either monarchies ruled by the same families or have republic status after independence from Western countries. Thus, it can be argued that the state (public) ownership of banks, as a dominant ownership structure, makes the MENA region a unique context compared with other regions of the world, which might influence the drivers of banks' credit ratings in the region.

On the other hand, MENA countries are sufficiently heterogeneous on the basis of macroeconomic characteristics, which also makes this setting interesting for research. For example, the MENA region comprises both oil-based economies, such as Saudi Arabia, UAE, and Qatar, and non-oil-based economies, including Egypt, Jordan and Tunisia, which leads to various degrees of economic growth in these countries (Malik & Masood, 2021). Similarly, MENA countries have substantial variations related to political instability (Lassoued et al., 2018). For example, MENA countries that underwent the so-called Arab Spring, such as Syria, Libya, and Yemen, have witnessed high political instability. In contrast, other MENA countries, including UAE, Kuwait, and Qatar, are politically stable. Likewise, the level of compliance with different corporate disclosure regulations, such as disclosures under the Sharia Supervisory Board (SSB), varies across Islamic and traditional banks in the region (Elamer et al., 2020). These variations allow us to comprehensively analyse the potential roles of voluntary disclosure quality and audit quality in enhancing or hindering Islamic and traditional banks' credit ratings across a selected sample of MENA economies.

3 Review of literature

3.1 Quality of Voluntary Disclosure and Credit ratings

Investors view voluntary disclosure as one of the essential types of non-financial information. Because voluntary disclosures are mostly narrative and public in nature, accuracy and certainty are critical to avoid disclosures becoming boilerplate and losing their value (Bozzolan and Miihkinen, 2021). Previous literature indicates that voluntary disclosure quality is an important mechanism through which management can affect credit ratings (Akorsu, 2023; Basu et al., 2022; Cao et al., 2024; Crabtree & Maher, 2012; Elamer et al., 2020; Grassa et al., 2020; He, 2018; Oh & Park, 2017). According to Vanhaverbeke et al. (2024), public disclosures generally impose a more significant influence on credit ratings than private information since credit analysts are likely to

1
2
3 prioritize unfavorable public information when modifying their risk evaluations. This
4 underscores that public disclosures can substantially impact credit ratings more than
5 private disclosures. High-quality public disclosures are expected to associate
6 positively with credit ratings, highlighting the significance of transparency and
7 accuracy in the information presented. Similarly, DeBoskey and Gillett (2013), He
8 (2018), and Elamer et al. (2020) underscore the essential function of comprehensive
9 public disclosures in improving enterprises' creditworthiness and analysts' risk
10 evaluations. In his investigation of the association between voluntary disclosure quality
11 and credit capital cost, Sengupta (1998) found that analysts' ratings of firms' disclosure
12 policies assist and explain bond yields and credit ratings. Sengupta (1998) also states
13 that a better quality of voluntary disclosure appeared to signal that a firm's managers
14 might withhold unfavorable news about its creditworthiness. Another study by Francis
15 et al. (2005) supported the notion that corporate disclosure quality is related to better
16 credit ratings and lower interest costs. From a different perspective, Mazumdar and
17 Sengupta (2005) argue that voluntary disclosure quality can decrease the spread of
18 private debt. Voluntary disclosure quality, from the point of view of Yu (2005), is
19 positively related to the spreads of secondary-market bond yield. Bharath et al. (2008)
20 also find better voluntary disclosure quality is attributed to lower interest costs and
21 bank debt. Heflin et al. (2011) investigated the impact of disclosure channels and credit
22 ratings, indicating a positive relationship between annual report disclosures' quality
23 and credit ratings among a sample of US firms. Hui and Lui (2012) investigated
24 managers' voluntary disclosure during credit watch periods in US firms, and findings
25 suggest that managers' voluntary disclosure increases during credit watches.
26 DeBoskey and Gillett (2013) claimed that credit rating is significantly associated with
27 disclosure information transparency in US firms and markets. He (2018) investigated
28 whether a voluntary disclosure is considered an instrument by which managers control
29 credit ratings, linking companies close to a rating change with a higher occurrence of
30 product and business expansion plan disclosures. Recently, Basu et al. (2022)
31 analyzed the impact of credit ratings on firms' voluntary disclosure behavior and found
32 that firms provide more voluntary disclosure following downgrading and less
33 disclosure, resulting in upgrades of their credit ratings.

Prior research on the financial sector claimed that the extent of disclosures is positively associated with credit ratings (Elamer, 2017; Grassa et al., 2020). More relatedly, Elamer (2017) shows a positive association between risk disclosure and credit ratings of banks, suggesting that increased transparency in risk disclosure is a tactic implemented by managers to decrease the asymmetric gap of information, signaling banks' quality and future prospects to the market. Most recently, Grassa et al. (2020) document a positive influence of banks' credit rating on conventional banks' risk disclosure compared to their Islamic banks' competitors. They argued that the reason behind this finding is that Islamic banks disclose less risk information than conventional banks due to the nature of business risk. From an agency theory perspective, credit rating agencies mitigate the agency conflicts between companies' management and other stakeholders by efficiently using the companies' disclosed information (Core, 2001; Hui & Lui, 2012). Jorion et al. (2005) argue that after the Securities and Exchange Commission (SEC) had implemented the regulation of fair disclosure on October 23, 2000, in the US, rating agencies were given access to managers' confidential information, which was not available to the other stakeholders of the companies. By having this access, the rating agencies are expected to highlight the bias in the voluntary disclosures during credit watch or rating of companies (Basu et al., 2022; Oh & Park, 2017). Kim and An (2021) claimed that high-quality disclosure, defined by its relevance, faithful representation, and timeliness, is critical in enabling rating agencies to estimate a company's default risk and future performance accurately. Thus, we argue that high-quality voluntary disclosure (characterized by transparency and completeness) enables credit rating agencies to better assess a bank's risk, which can positively affect the bank's credit rating. This aligns with agency theory, where increased transparency through high-quality disclosures helps reduce informational conflicts among stakeholders and thereby fosters better credit ratings. Based on this argument and the findings of related prior studies (e.g., DeBoskey & Gillett, 2013; He, 2018; Heflin et al., 2011), we hypothesize that higher-quality voluntary disclosure, which encompasses both transparent and comprehensive information, is positively associated with a bank's credit rating. Hence, we formulate the following hypothesis:

H₁ = High-quality voluntary disclosure positively influences the credit rating of both Islamic and non-Islamic banks.

3.2 Auditor choice and credit ratings

According to audit literature, several studies have shown compelling evidence that Big-4 companies deliver superior quality auditing because of their higher reputation and lawsuit risk, as well as the better skills of Big-4 auditors (Bozzolan and Miihkinen, 2021; Defond & Zhang, 2014; Lennox & Pittman, 2010; Komal et al., 2023). Prior research also indicated that external audit reputation certainly matters for big audit firms (Usman et al., 2022; Usman et al., 2023) and is welcomed by the audit committee (Bilal et al., 2023; Bilal et al., 2024; Komal et al., 2022; Komal et al., 2023). Audit reputation is associated with higher voluntary disclosure quality and plays a crucial role in reducing information asymmetries between corporate managers and stakeholders (Ahmadi & Bouri, 2019; Chalmers & Godfrey, 2004; Wardhani, 2019). Crucially, Big 4 auditors provide insurance protection, affecting debt pricing in public firms (Mansi et al., 2004; Pittman & Fortin, 2004). In this context, Fortin and Pittman (2007) investigate the relationship between Big 4 auditors and credit ratings in US private firms and fail to find a significant association. Likewise, Dedman and Kausar (2012) also failed to find a relationship between the Big 4 auditors and credit ratings in the case of UK private firms. In the case of public companies, nevertheless, Strickett and Hay (2015) and Strickett et al. (2022) document that going concern opinions issued by the Big 4 auditors are linked with companies' credit ratings. Zalata et al. (2020) and Moalla and Baili (2019) fail to find a relationship between the Big 4 auditors and credit ratings. Recently, Akorsu (2023) found that previous evidence is inconclusive, implying an ongoing debate regarding the relationship between the big 4 auditors and credit ratings. Our study, therefore, adds to this debate by providing new insights into the relationship between auditor choice and credit rating of banks operating in the MENA region.

Theoretically, Big 4 auditors and credit rating agencies can play a critical role in alleviating agency conflicts between agents (managers) and (principles) shareholders (Moalla & Baili, 2019). As a result of information asymmetry issues, stakeholders increase their demands for information (voluntary disclosures) from the market intermediaries, including credit rating agencies and independent auditors (Ashbaugh-Skaife et al., 2006). The selection of highly reputable and qualified auditors may contribute to more efficiency in addressing contracting problems by lowering information risks about borrowers (Jensen & Meckling, 1976). In a consistent view,

Ahmadi and Bouri (2019) claimed that Big4 auditors' clients are likely to publicly disclose more financial and non-financial information. Based on this argument, we expect a positive relationship between Big 4 auditors and credit ratings as Big 4 auditors consider the credit ratings while giving their opinions (Strickett et al., 2022). Therefore, we hypothesized that:

H₂ = Big-4 auditors are positively associated with the credit rating of both Islamic and non-Islamic banks.

3.3 Joint Audit and Credit Ratings

Some corporations deal with two or more audit companies to strengthen external auditors' independence. The selection of two different auditors rather than one indicates 'good news' to the market (Teoh et al., 1998; Titman & Trueman, 1986) about the disclosure quality of the client firm. Two reasons can justify the use of joint audits. First, as mentioned earlier, financial statement users, such as lenders, believe that two auditors at once are less likely to accede to a client's pressures, which signals a higher assurance value. Second, drawing on the 'insurance hypothesis', audits are likely to add value by offering indirect insurance to investors (Wallace, 2004). In audit failure scenarios, investors can prosecute auditors for compensating their losses if a credit loss relates to misleading financial information. In this regard, Zerni et al. (2012) document that companies opting voluntarily for joint audits have better credit ratings in the voluntary Swedish joint audit setting. Recently, Ahmadi and Bouri (2019) found a positive influence of joint audits on the voluntary disclosure index in the Tunisian context. As a governance mechanism, the audit's most crucial role is to diminish the asymmetric gap of information between shareholders or third-party contractors and managers. Thus, we expect that credit rating agencies perceive joint audits of banks as an indicator of a high-quality audit, which is expected to enhance the banks' credit ratings. Therefore, we hypothesize that:

H₃ = Co-audit is positively associated with Islamic and non-Islamic banks' credit ratings.

3.4 Audit Opinion and Credit Ratings

Although credit rating agencies and auditors deliver a similar public service to stock markets, including audit opinion and credit rating, a few studies examined the

1
2
3 association between credit rating and auditor opinion (Cha et al., 2016; Feldmann &
4 Read, 2013; Funcke, 2015; Moalla & Baili, 2019). For example, Feldmann and Read
5 (2013) and Funcke (2015) examined the influence of credit ratings on auditors'
6 decisions in the US setting. Their empirical evidence shows that low credit rating firms
7 are expected to be given a going-concern judgment. Likewise, Feldmann and Read
8 (2013) provided evidence suggesting auditors tend to be more conservative when
9 S&P's rating is nearer to default and that a credit rating implies low solvency outcomes
10 in a more critical assessment. Also, Funcke (2015) shows that credit rating affects
11 auditors' decisions by including further information that enables more accurate and
12 transparent decisions.
13
14
15
16
17
18
19

20
21 Similarly, Cha et al. (2016) examined the relationship between credit ratings
22 and auditors' opinions on financially distressed firms in Korea. They found a negative
23 association between credit rating and the modification of going-concern. Recently,
24 Moalla and Baili (2019) investigated whether credit ratings offered by Fitch can predict
25 auditors' opinions for a selected sample of Tunisian financial institutions. They found
26 that firms with low ratings are likely to obtain a modified audit opinion. Besides,
27 **Strickett et al. (2022)** reported that the chances of a going-concern opinion are
28 associated with one month prior to credit ratings issued by S&P and Moody rating
29 agencies. Using a sample of companies that filed for bankruptcy, they claimed that
30 S&P and Moody rating agencies had downgraded almost 68% and 24% of companies
31 after one month of going-concern opinion, respectively. Thus, auditors consider the
32 companies' credit ratings when making their opinions because of the estimated lower
33 audit fees linked with a going-concern opinion. In case of poor credit rating, the
34 company's auditor is in a position to issue a going-concern opinion without hesitation.
35 In existing studies, however, there is no evidence of the credit rating-audit opinion
36 nexus in the banking sector. Therefore, we extend the current literature by examining
37 the potential impact of audit opinion on banks' credit rating in emerging economies.
38 Based on the above discussion, we hypothesize the following.
39
40
41
42
43
44
45

4 Data and Methodology

4.1 Sample selection

We gathered the financial data from DataStream, credit rating data from S&P and FitchConnect, and hand-collect the voluntary disclosure data from banks' annual reports. The credit-rating scores were obtained from two international credit rating agencies, which are Fitch and Standards and Poor's. Our sample covers all Islamic and conventional banks operating in 17 emerging countries¹. Since Islamic banks implemented IFRS in 2006, our sample utilizes annual data over 15 years from 2006 to 2020. The inclusion of data covering the COVID-19 period (2021 and 2022) may introduce confounding variables, potentially leading to skewed results or conclusions. Consequently, to ensure the reliability and validity of our findings, we have deliberately restricted our focus solely to data up to the year 2020. The MENA region was selected because it obtained the second-place ranking in terms of banking sector growth (Salem et al., 2021), characterized by a large number of Islamic banks (Maatoug et al., 2019), and witnessed political turmoil exacerbated by the Arab Spring (Abdelsalam et al., 2016). Also, the economy of the MENA region is characterized by either oil or tourism revenues. As well, leverage, bank size, and asset tangibility are almost comparable throughout the region (Salem et al., 2021). Most crucially, MENA countries have witnessed rapid and fluctuating credit growth rates, raising concerns about the financial system's stability, especially given the assumption that any increased credit growth is likely to be followed by financial crises (Bitar et al., 2016; Crowley., 2008). Additionally, the MENA region attracts investors and bankers worldwide because it links developing and developed countries in Africa, Asia, and Europe (Bitar et al., 2016). As a result, examining the drivers of banks' credit ratings in this region has implications far beyond its borders. Furthermore, the findings of this study may aid regulators and policymakers in enhancing macroeconomic bank governance by establishing rules and regulations to promote bank performance, transparency, and competition. We carefully revised the data for the entire period to ensure data availability and reduce discrepancies. Thus, banks with insufficient data regarding credit ratings, voluntary disclosure, and audit quality were excluded from the

¹ These countries include; Kuwait, Lebanon, Palestine, Oman, Egypt, Qatar, Morocco, UAE, Syria, Iraq, Yemen, Tunisia, Bahrain, Israel Jordan, Saudi Arabia and Iran.

Expects Data Sharing: The authors confirm that all data underlying the findings and any other supporting information are available on request.

sample. Our final sample consists of 435 and 1155 bank-year observations that apply to Islamic and conventional banks for our empirical analyses, respectively (see Table 1).

4.2 Credit rating measurement

The credit rating agencies have a critical function in affecting the debt holders' decisions because the given rate (score) reflects the agency's assessment of banks' ability to pay their outstanding obligations on time and in full. In this respect, our dependent variable is the credit rating score given by those agencies based on the banks' creditworthiness with respect to their long-term debt obligations. The highest rating score is AAA (Prime), and the poorest rating score is D (in Default). Following prior studies, firstly, we converted the credit ratings into seven categories that convey systematic risk assessments (Boumparis et al., 2019; Grassa et al., 2020; Hui et al., 2020; Oh and Park., 2017). Respectively, a value of 7 is given to banks with the highest credit rate (AAA), and a value of 1 is given to banks with the lowest credit rate (**D, C, CC, CCC, CCC+**). Therefore, each group is mapped into a series of credit ratings as follows: Rating Group 7: AAA, Rating Group 6: AA-, AA, AA+, Rating Group 5: A-, A, A+, Rating Group 4: BBB-, BBB, BBB+, Rating group 3: BB-, BB, BB+, Rating Group 2: B-, B, B+, Rating group 1: D, C, CC, CCC, CCC+. We used an additional credit rating measure to ensure our findings' reliability. Particularly, we followed Oh and Park (2017) by using an indicator variable that is equal to 1 if the credit rating level is in the range of "A- to AAA" and 0 otherwise. This measurement mirrors the assessment given by those attracted to the information disclosed about the bank's fundamentals, that is, bondholders and credit-rating agencies. The speculative grade and investment grade were used as a classification scheme in order to facilitate the discussion of the economic importance of the regression outcome.

4.3 Quality of Voluntary Disclosure Measurement

We adopted the same framework as Salem et al. (2020) to obtain the quality of information disclosed voluntarily in the annual reports through three dimensions: quantity, spread, and usefulness. This approach covers the disclosed information's quantitative and qualitative features (Salem et al., 2020). We hand-collected the voluntary disclosure information from the annual reports of 1590 bank-year

observations across 17 emerging countries from 2006 to 2020. The measurement of each dimension is explained in the following section:

4.3.1 Quantity Dimension

The first dimension focuses on the quantity (level) of the information disclosed each year by adjusting the amount disclosed by bank type and size. The disclosure level is directly impacted by the business's size and complexity (Rezaee and Tuo, 2019; Salem et al., 2020). Therefore, we take into account the variation in size and bank type to ensure the effectiveness in estimating the quantity of disclosure (Q_STR) dimension (Beretta and Bozzolan, 2008). Although some MENA countries comply with the Basel I agreement regulations, others decide not to comply with some requirements and prefer not to disclose every mandatory information (Alber and Ramadan., 2022; Bitar et al., 2016). Consequently, we designed a comprehensive disclosure index containing all elements still contested and should be provided at least voluntarily to fulfill investors' expectations. Following Adelopo et al. (2021), Hassan and Marston (2019), and Salem et al. (2020), a content analysis approach with an index that consists of voluntary disclosure items relevant to banks operating in MENA is adopted (see Appendix A). Consequently, the number of words is adjusted by bank size, and type is used to measure the Q_STR dimension. Following Beretta and Bozzolan (2008) and Salem et al. (2020), the OLS regression² was employed to estimate the quantity dimension proxy. We computed R_Q by subtracting the residual (anticipated transparency) from the overall frequency of revealed elements.

The following is the standardized formula:

$$Q_STR_{it} = 1 - \frac{Max_R_Q - R_Q_{it}}{Max_R_Q - Min_R_Q}$$

Where:

Q_STR_{it} = standardized relative quantity index for the bank i at year t .

² We employed OLS regression to estimate the quantity of disclosure by controlling for bank size and type, as these factors significantly influence disclosure levels (Rezaee & Tuo, 2019; Salem et al., 2020). Specifically, the OLS regression was used to compute the residuals (R_Qit), representing the anticipated transparency of each bank. The standardized formula for Q_STR is derived by adjusting for these residuals, ensuring that the variation in size and type is accounted for. The residuals (R_Qit) from the OLS regression capture the difference between the observed and expected levels of disclosure for each bank-year observation. These residuals represent the unanticipated or relative disclosure quantity, adjusting for the influence of size and type. We then used these residuals in the standardization formula to calculate Q_STR, the standardized relative quantity index.

$R_{Q_{it}}$ = is the relative quantity index, which is the residual for the bank i at year t obtained after controlling the bank's size.

Max_R_Q and Min_R_Q represent the maximum and minimum residuals.

In the estimation of Q_STR , we control for both bank size and type. $R_{Q_{it}}$ represents the firm-specific residual for bank i in year t , while Max_R_Q and Min_R_Q are the maximum and minimum residuals across the entire sample. This approach ensures that the quantity of disclosure is standardized across the sample, allowing for valid comparisons between banks of different sizes and types. In cases where Max_R_Q is equal to $R_{Q_{it}}$, a standard value for Q_STR is applied to avoid undefined outcomes.

4.3.2 The Spread Dimension

This dimension concentrates on the dispersion ($DISP_E$) and the coverage (COV_E) of the information revealed by banks that should satisfy several stakeholders' desires (Salem et al., 2020). Following Beretta and Bozzolan (2008) and Beattie et al. (2004), we used the ratio of the information disclosed (items) from the overall number of items in the checklist as a proxy of coverage. Consequently, the greatest value (1) is awarded if each of the checklist's themes (sub-topics) is reported in the bank's annual report, while the lowest value (0) is assigned if no topics are disclosed. We employed the formula below to measure the coverage³.

$$COV_E_{it} = \frac{1}{st} \sum_{j=1}^s IN_F$$

Where

$IN_F = 1$ if bank i revealed information about item j at year t and 0 otherwise. s is the number of subcategories. On the other hand, the dispersion ($DISP_E$) of items revealed in the annual report within the disclosure checklist is adopted to indicate the concentration. This method measures whether managers emphasize (signaling) certain items or offer a comprehensive and wide range of information within the checklist. We adopted the formula used by Salem et al. (2020) and Beretta and Bozzolan (2008) to measure the $DISP_E$:

³ A detailed explanation about the measurement of each dimension can be found at:

Beretta, S. and Bozzolan, S., (2008). Quality versus quantity: the case of forward-looking disclosure. *Journal of Accounting, Auditing & Finance*, 23(3), pp.333-376.

Beattie, V., McInnes, B. and Fearnley, S., (2004), September. A methodology for analysing and evaluating narratives in annual reports: a comprehensive descriptive profile and metrics for disclosure quality attributes. In *Accounting forum* (Vol. 28, No. 3, pp. 205-236).

$$\text{DISP_E}_{it} = 1 - \sum_{j=1}^n H_j^2$$

Where;

H_j = is the ratio of revealed item i captured by the item disclosure frequency in category j at year t .

Consequently, the average of DISP_E and COV_E is employed as a proxy for the spread dimension:

$$S_PR_{it} = \frac{1}{2} (\text{DISP_E}_{it} + \text{COV_E}_{it})$$

4.3.3 The Dimension of Usefulness

To address the potential varying effects of revealed items on corporate credit ratings, we go beyond a binary coding technique. Alongside categorizing the existence or absence of disclosure items, we evaluate the quality of the given information based on the IFRS qualitative attributes of faithful representation, understandability, relevance, comparability, and timeliness (IFRS 2010; Salem et al., 2020). This multi-faceted strategy guarantees that the substance and nature of disclosures are sufficiently documented, illustrating their potential influence on stakeholder views, including credit ratings. By incorporating both quantitative and qualitative characteristics, we guarantee a thorough assessment of voluntary disclosures. To measure the usefulness dimension, we adopted Salem et al.'s (2020) index with a rating scale of five points (see Appendix B). However, timeliness is obtained through the natural logarithm of the number of days between the year-end and the auditor's signature. Consistent with Alotaibi and Hussainey (2016) and Salem et al. (2020), we employed the weighted technique of the qualitative characteristics as follows:

$$\text{USE_FU} = \frac{1}{5} (\text{Faithfulness} + \text{Understandability} + \text{Relevance} + \text{Comparability} + \text{Timeliness})$$

To obtain the quality of voluntary disclosure (Q_VD), we used the following formula:

$$\text{Q_VD} = \frac{1}{3} (\text{Q_STR}_{it} + S_PR_{it} + \text{USE_FU})$$

To ensure the validity of our overall measurement, our checklists were based on an analysis of international trends, relevant research studies, and observations of standard reporting practices (Lemma et al., 2020). Therefore, the specified items are

1
2
3 considered relevant and more likely to be disclosed by banks. On the other hand, to
4 confirm the reliability of the adopted disclosure index, we employed multiple coders⁴
5 to score the research instrument. Then, the emerged coding scores were discussed
6 and compared, and variances were resolved accordingly (Alotaibi and Hussainey,
7 2016; Salem et al., 2020). Following Nekhili et al.'s (2017) argument, the market
8 responds positively to the quality of disclosed information. We employed the market-
9 based value (MBV)⁵ to verify whether the captured disclosure relates to market
10 reaction. Our untabulated results confirm that the quality of disclosed information is
11 positively linked with MBV at a 1% level. This outcome aligns with the argument that
12 high-quality information will likely help investors forecast banks' earnings in the
13 subsequent year. Therefore, this experimental evidence supports the reliability and
14 validity of the quality of voluntary disclosure measurement.

25 **4.4 Audit quality measurement**

26 Following previous studies (Ahmadi and Bouri., 2019; Hu., 2011; Salem et al., 2021;
27 Wardhani, 2019), we used three audit quality proxies: Big-4, Co-audit, and audit
28 opinion. Ahmadi and Bouri (2019) indicated that a big-size audit firm (Big-4) enhances
29 the disclosure quality, decreasing the asymmetric information gap between directors,
30 stockholders, and other regulatory bodies such as credit agencies. Stockholders
31 expect big audit firms (Big-4) to be able to fulfill professional audit quality since they
32 have superior resources and reputations. Therefore, **Big-4** is measured by employing
33 a dummy variable which takes the value 1 if a Big-4 company audits the bank and 0
34 otherwise.

35 Additionally, Ahmadi and Bouri (2019) and Salem et al. (2021) illustrate that the
36 cooperation of two audit firms confirms the audit quality in terms of competence and
37 independence, which in turn reduces any possible control of auditees. Therefore, the
38 existence of the two audit firms increases audit independence and reduces possible
39 collusion between auditors and managers. Consequently, we measured **Co-audit**
40 using a dummy variable that takes the value of 1 if two audit firms audit a bank and 0
41 otherwise. In addition, going-concern audit opinion is used as a signal of audit quality
42 to stockholders and regulatory bodies. Moalla and Baili (2019) and Siregar et al. (2020)
43 demonstrate that external auditors provide going-concern audit opinions if the firm

4 Four coders were involved in this procedure to ensure the accuracy and uniformity of the scoring.

5 MBV= it is calculated using the aggregate of both earnings per share (EPS) and Tobin's Q

cannot pay its obligations and cannot maintain its business continuity, which, in turn, affects its credit rating. Thus, we measured the going-concern audit opinion (**A-Opin**) using a dummy variable that takes the value of 1 if an auditor issued a going-concern opinion and 0 otherwise.

4.5 Empirical model

Our study applied the following model to investigate whether the quality of voluntary disclosure and audit quality influence the credit rating of both Islamic and conventional banks. We used equation (1)⁶ for the full sample and two subsamples (conventional and Islamic banks) independently since directors' incentives vary from their needs and the ability towards voluntary disclosure and upholding their credit rating.

$$CR_{it} = \beta_0 + \beta_1 Q_VD_{it} + \beta_2 A_Q_{it} + \beta_3 \text{Audit Committee Characteristics}_{it} + \beta_4 \text{Bank Characteristics}_{it} + \beta_5 \text{Bank-type} + \beta_6 \text{Country_effect}_{it} \quad (1)$$

Where;

CR is the dependent variable which is the assigned score by the credit rating agencies to bank *i* in year *t*. **Q_VD_{it}** and **A_Q_{it}** represent the quality of voluntary disclosure value and audit quality proxies as defined in Appendix 1. The audit quality proxies (**A_Q_{it}**) include **Big_4**, **Co-audit**, and **A-Opin**.

Additionally, we included Audit Committee Characteristics (IAC, ACZ, and ACM), which may have a potential association with enhancing both the quality of voluntary disclosure and banks' credit rating. **IAC** is measured as the number of independent directors on the audit committee scaled by the total number of audit committee members, **ACZ** represents the size of the audit committee, and **ACM** represents the total number of audit committee meetings held in a financial year.

Based on prior research (Alali et al., 2012; Ahmadi and Bouri, 2019; Basuet al., 2017; Grassa, 2016; Grassa et al., 2020; He., 2018; Oh and Park, 2017; Siregar et al., 2020; Sahyoun and Magnan., 2020; Tepalagul and Lin, 2015; Wardhani, 2019), several control variables at the bank and country levels were adopted, which may

⁶ appendix 1 shows the measurement, definitions and source of all study variables used in the model.

influence the associations among voluntary disclosure quality, audit quality, and credit ratings. In particular, we considered six bank-level factors to control for the cross-sectional variances in bank characteristics. We isolated the effect of **bank size** following Salem et al. (2020) and Salem et al. (2021) and used the natural logarithm of total assets as our measure of bank size. We also controlled for firm **leverage** to account for the impact of gearing on disclosure practices. Following previous studies (Ezeani et al., 2022), we measured leverage as total liabilities divided by total assets. We also accounted for **growth** among banks in our sample and measured growth as the change in total assets scaled by the lag of total assets. Previous studies suggest that profitability influences banks' corporate disclosure (Salem et al., 2023a; Salem et al., 2021). We, therefore, controlled for **profitability** using net income scaled by the lag of total assets as its measure. To measure banks' capital in relation to their risks, we include the **capital adequacy ratio** that represents the proportion of actual regulatory capital (Tier 1 capital) divided by the total assets. Empirical studies documented a link between bank liquidity and its rating (Shen et al., 2012; Varotto, 2011). Therefore, we controlled for **liquidity**, which was measured as current assets scaled by current liabilities. Furthermore, we included Bank-type when examining the full sample to differentiate between Islamic and conventional banks and to test its impact on the association between CR and Q_VD. **Bank-type** is a dummy variable that assigns 1 to Islamic banks and 0 to conventional banks. In addition, many MENA nations, including Tunisia, Yemen, Egypt, Syria, and Iraq, suffered political turmoil in 2011, which significantly affected their economy (Salem et al., 2021). Since our sample consists of banks operating in countries experiencing political problems, we followed Abdelsalam et al. (2016) and controlled for country-specific effects from 2011 to 2016. Consequently, the political turmoil variable (**PT**) is created and measured as a dummy variable that takes the value of 1 if a bank is based in Egypt, Yemen, Syria, Tunisia, or Iraq and 0 otherwise.

Our analysis employed two types of credit rating measures as dependent variables: a seven-category credit rating scale (ordinal) and a binary indicator for investment grade (Grassa et al., 2020; Oh and Park, 2017). We utilized an ordered logit panel regression model for the ordinal measure to accommodate the ordered characteristics of the credit rating variable (CR2). We employed a logit panel regression model for the binary classification (CR1), suitable for dichotomous

1
2
3 outcomes (Grassa et al., 2020). These models guarantee that the statistical methods
4 correspond with the characteristics of the dependent variables, therefore yielding
5 robust and dependable results. Following Usman and Tandelilin (2014), a Chow test
6 is adopted to identify whether panel or pool regression is suitable for our model and
7 dataset. We found that F statistics is significant at the 1% level for the full sample and
8 subsamples (Islamic and conventional banks). This finding approves the suitability of
9 panel data regression. Furthermore, we used the Hausman specification test to
10 identify whether fixed or random effects regression is the most suitable approach for
11 our sample. The result (untabulated) confirms that the random-effects model is the
12 most appropriate method (Prob > Chi2 = 0.1121 and 0.1123) for our dataset.
13
14
15
16
17
18
19
20

21 The operational and governance frameworks of Islamic and conventional banks
22 exhibit substantial differences, especially regarding disclosure and audit practices
23 (Salem et al. 2021). IBs operate under Shariah rules, which mandate ethical
24 responsibilities for their financial activities (Elnahass et al. 2014), affecting both the
25 quality of their disclosures and their auditing techniques (Abdallah et al. 2015). In
26 contrast to traditional banks, which promote financial disclosure aimed at maximizing
27 shareholder value, IBs are also required to adhere to religious and ethical standards
28 (Lassoued et al., 2018; Farook et al., 2014). This results in greater transparency and
29 enhances voluntary disclosure, particularly concerning governance and social
30 responsibility (Farook et al., 2014). Additionally, IBs engage in dual audits: one for
31 financial reporting and another for Shariah compliance, regulated by Shariah
32 supervisory boards. The audit quality in IBs is consequently more stringent since it
33 integrates both financial efficiency and compliance with religious norms (Grassa,
34 2015). The incorporation of external auditors, including Big-4, and the integration of
35 ethical auditing procedures enhance the overall audit quality in IBs compared to their
36 conventional counterparts (Salem et al., 2021). The unique governance processes of
37 IBs foster the perception of them as more risk-averse and ethically accountable,
38 underscoring the necessity for a comparative analysis between IBs and NIBs in
39 research concerning financial reporting, governance, and credit ratings.

5. Empirical results and discussion

5.1 Sample statistics

Table 2 reports the credit rating distribution of all available bank-year observations over the entire sample, conventional and Islamic banks. The A grade (seen in Table 2) is a cut-off point to differentiate whether the bank is assessed highly in the market or poorly. Among the total 1590 bank-year observations, 493 observations (31%) have a credit-rating grade equal to or greater than 'A-' in the entire sample. However, 59% of Islamic bank observations have a higher credit rating than 20% of those conventional banks. This result suggests that the unique governance structure of Islamic banks might have improved their credit rating. However, Table 3 (panels A, B, and C) shows the credit rating distribution over the entire sample, conventional and Islamic banks, sorted by year, respectively. The summary statistics in the three panels show a fluctuation in the banks' credit rating levels after the financial crisis. This finding is in line with those reported by Reusens and Croux (2017), who indicated that the credit rating agencies had poorly judged the significance of the diverse determinants of credit rating with respect to default risk before the crisis and permanently adjusted their rating methodology after 2009 (Kiff et al., 2010).

Insert Table 2

Insert Table 3

5.2 Descriptive statistics

Table 4 illustrates the descriptive statistics with respect to conventional and Islamic banks. The mean values of CR1 and CR2 as proxies for credit rating are 25%, 3.84, 66%, and 4.48 in conventional and Islamic banks, respectively. This finding suggests that Islamic banks are highly rated (evaluated) compared to their competitors. This favorable rating could be attributed to compliance with Shariah law and the existence of the Shariah board in Islamic banks, which have an efficient monitoring mechanism that ensures the capacity of the bank to satisfy its financial obligations (Grassa, 2015). These outcomes align with Grassa et al. (2020) and Grassa (2015). On average, the mean value of Q_VD in conventional banks is slightly higher than that of Islamic banks by 2%. Our result is consistent with Grassa et al. (2020) and Grassa et al. (2019). However, our result is 40% higher than that of Ghosh (2018), who investigated the level of disclosure in MENA banks from 2000 to 2012. This inconsistency could be

1
2
3 attributed to the implementation of IFRS post-2006 (Elnahass et al., 2014) and the
4 difference in the method used to capture the quality of disclosed information.
5
6

7 Regarding audit quality, Table 4 reports that the mean values of Big-4, Co-audit,
8 and A-Opin are (72%, 57%, 4.9%) and (54%, 36%, and 4.7%) in Islamic and
9 conventional banks, respectively. These outcomes indicate that the audit quality of
10 Islamic banks is higher when compared with its competitors and in line with prior
11 studies (Salem et al., 2021; Inaam and Khamoussi., 2016).
12
13
14
15

16 Table 5 presents the outputs of the variation in the mean values of the main
17 variables using inferential statistic tests and additional non-parametric (Wilcoxon
18 signed ranks). The comparison tests show a significant difference in the mean values
19 of the credit rating proxies between conventional and Islamic banks at a 1% level.
20 Consistent with Grassa et al. (2020), our findings suggest that Islamic banks are highly
21 valued (ranked) compared with their competitors. This outcome is in line with the
22 argument that ethically, religiously, and socially responsible banks show risk aversion
23 (Salem et al., 2021) and are more likely to meet their financial obligations (Grassa,
24 2015).
25
26
27
28
29
30
31
32

33 On the other hand, the mean values of Q_VD are significantly different at a 1%
34 level and slightly higher in conventional banks compared with Islamic banks. Our
35 findings are consistent with previous studies (Grassa et al., 2020; Grassa et al., 2019).
36 The mean values of Big-4 and Co-audit as proxies for audit quality show a significant
37 difference at a 1% level and higher in Islamic banks compared with their traditional
38 counterparts, while A-Opin has an insignificant difference. This outcome aligns with
39 the argument that Islamic banks' docility by the Accounting and Auditing Organization
40 for Islamic Financial Institutions (AAOIFI) framework improves the quality of their
41 financial reporting and financial performance.
42
43
44
45
46
47
48

49 Table 6 describes the correlation matrix between the study variables.
50 Consistent with Gujarati and Porter (2009). The correlation coefficients of all
51 explanatory variables in Islamic and conventional banks are below the conventional
52 threshold, confirming the absence of a multicollinearity issue.
53
54
55

56 **Insert Table 4**

57 **Insert Table 5**
58
59
60

Insert Table 6**5.3 Regression results:**

Table 7 reports the relationship between CR, Q_VD, and AQ for the entire sample, as well as conventional and Islamic banks, respectively. We used Panel regression to examine the predicted association between the study variables and satisfy the exogeneity and the relevance conditions. In this regard, the Random-effects model is employed due to an insignificant P-value of the Hausman specification test (Salem et al., 2020). As expected in **H₁**, **H₂**, and **H₃**, high quality of disclosed information, Big-4 and Co-audit (as proxies for audit quality) are positively associated with the credit rating of both conventional and Islamic banks. Unlike the audit opinion (**H₄**), which has an insignificant impact on the credit rating. Our results suggested that banks with high-quality disclosure, audited by big-4 and an extra professional audit firm, are more likely to meet their long- and short-term obligations (Grassa, 2015). Our findings are consistent with those results reported by Salem et al. (2020) that audit quality enhances the financial reporting quality, and corporate disclosure is positively linked with credit rating (Grassa, 2020).

Regarding the control variables, IAC and ACM have a positive association with improving banks' credit rating in both Islamic and conventional banks. In contrast, ACZ, bank size, and LIQ have insignificant links with credit rating in Islamic Banks. Furthermore, the bank type variable is positively attributed to bank credit rating across the entire sample. This finding corroborates the outcome of Table 5, indicating that Islamic banks are highly ranked and well regarded compared to their traditional counterparts (Grassa et al., 2020; Salem et al., 2021).

Insert Table 7

We also investigated the sensitivity of the Q_VD's dimensions on credit rating in both conventional and Islamic banks separately. Table 8 reports that the quantity dimension (Q_STR) has an insignificant association with credit ratings in both types of banks. However, the usefulness and spread dimensions show a positive and significant association with credit ratings in both types of banks. These outcomes are in line with the main findings presented in Table 7 and consistent with the argument that the quality of voluntary disclosure is more likely to be directly connected to the

1
2
3 usefulness and spread of information rather than the quantity (level) of disclosed
4 information (Beretta and Bozzolan, 2008; Salem et al., 2020). With respect to the audit
5 quality, Big-4 and Co-audit are positively attributable to the bank's credit ratings,
6 whereas A-Opin has an insignificant association with credit ratings, which supports the
7 main outcomes.
8
9

10
11 Table 9 examines the robustness of the association of audit quality with the
12 credit ratings without including the voluntary disclosure quality (Q_VD) variable, which
13 might have affected the main relationship. Remarkably, our findings confirm that audit
14 quality proxies (Big-4 and Co-audit) have positive and significant associations with
15 credit ratings in both conventional and Islamic banks. At the same time, audit opinion
16 is negatively and significantly associated with credit ratings in conventional and Islamic
17 banks. These findings support the main findings presented in Table 7 and are
18 consistent with the theoretical argument that firms with high audit quality would be
19 efficiently monitored by directors to ensure meeting their financial obligations (Grassa,
20 2015).

32 **5.4 Additional analysis**

33
34 Our study provides several additional analyses to investigate the robustness of our
35 primary findings. Firstly, an alternative measure for credit ratings is used to determine
36 the robustness of the main results of various credit rating measures. Following prior
37 studies, we converted the credit rating into a numerical score using an ordinal scale
38 that ranges from 22 for the highest-rated bank (AAA) to 1 for the poorest-rated bank
39 (D) (Grassa et al., 2020; Gillette et al., 2020; He, G., 2018; Kisgen, D.J., 2019). Our
40 findings, which are presented in Table 10, illustrate that both Q_VD and audit quality
41 (Big-4 and Co-audit) are significantly linked with CR, suggesting that our primary
42 outcomes are robust to alternative CR proxies. In addition, IAC and ACZ positively
43 correlate with improving the credit ratings of conventional and Islamic banks.
44
45
46
47
48
49
50
51
52
53

54
55 Secondly, we investigate whether the effect of Q_VD on CR varies between
56 banks with high Q_VD and low Q_VD to obtain confidence in our analysis that the
57 main findings signify the association of Q_VD with CR. Therefore, we employed the
58
59
60

1
2
3 median value of Q_VD as a cut-off point to divide the sample into two sub-sets⁷. Table
4 11 reports that banks associated with high Q_VD, audited by Big-4 with additional
5 auditing firms, are more likely to be associated with high credit ratings. In contrast,
6 audit opinion seems to have a negative association with banks' credit ratings. On the
7 other hand, banks with low Q_VD have an insignificant connection with CR. This
8 finding could be attributed to the fact that large-sized banks are primarily associated
9 with high Q_VD and face more robust monitoring mechanisms employed by regulators
10 that assist directors in controlling their debt structure and default risk (Alali et al., 2012;
11 Alissa et al., 2013).

22 **Insert Table 11**

23 24 **5.5 Robustness tests**

25
26 Besides the additional analysis, we re-estimated our model to examine the robustness
27 of the main findings by using different samples of banks with similar incentives to
28 enhance their credit ratings. We argue that banks with high profitability, high growth,
29 and low leverage are more likely to pose a lower default risk and meet capital
30 obligations, leading to a higher credit rating (Alissa et al., 2013). Also, we divided the
31 sample into two subsamples to control the financial crisis (Elbannan and Elbannan,
32 2015; Salem et al., 2021). Therefore, we investigated a set of sub-samples, including
33 bank years with high growth, high profitability, and low leverage before and after the
34 financial crisis. The findings presented in Table 12 (Panel A and B) are like those
35 revealed in the primary results and confirm that Q_VD and audit quality are positively
36 correlated to banks' credit ratings.

Endogeneity concerns may arise due to possible reverse causality or unobservable heterogeneity between dependent and independent variables. Better credit ratings, for example, may cut the cost of bank borrowing, allowing more resources to be allocated to enhancing transparency and audit quality. In this respect, credit ratings depend on the quality of both disclosure and audit practices; therefore,

⁷ Banks with a value below the median value are identified as low Q_VD banks and banks with a value equal or above the median value are considered as high Q_VD banks.

1
2
3 we may encounter the reverse causality problem between the outcome variable and
4 predictors.
5
6

7 We apply three different procedures to address endogeneity problems. Firstly,
8 following Harris et al. (2019), we add the lagged values of Q_VD to lessen the
9 endogeneity and reassess our main outcomes. Table 13 (Panel A) reveals that the
10 findings are in line with those reported in Table 7, signifying that the existence of the
11 endogeneity issue does not influence our findings. Secondly, we controlled for the
12 endogeneity issue by conducting 2SLS regression, following Abdelfattah and Aboud
13 (2020) and Lin et al. (2017), where bank-type is employed as an instrumental variable.
14 The employed instrument is considered valid since there is an insignificant correlation
15 between the study variables and the error (AR1 Pr=0.165 and AR2 Pr=0.274). The
16 findings reported in Table 13 (Panel B) are consistent with our primary results.
17
18
19
20
21
22
23
24

25 As a common endogeneity check technique, we adopted the GMM estimation
26 method to address the potential endogeneity issue and weighted sample moment
27 conditions following Issa et al. (2021). GMM method fits with a wide range of
28 explanatory factors that are less likely to be strictly exogenous and linked to current
29 realizations of inaccuracy (Arellano & Bond, 1991; Kim et al., 2014). Additionally, the
30 GMM method maximizes estimation reliability by reducing issues caused by
31 underpowered instruments and preventing proliferation (Dhaliwal et al., 2011).
32 Further, to evaluate the accuracy of the dynamic GMM estimator, the Arellano-Bond
33 test and the Hansen test are implemented. The results of these tests are insignificant,
34 implying that our variables are exogenous and that the GMM model is a suitable
35 estimator to address the possibility of endogeneity problems. The findings reported in
36 Table 13 (Panel C) provide evidence that our main variables of interest are in line with
37 the primary result.

50 51 52 53 **6. Conclusion**

54
55 **Previous studies were limited to the impact of the extent (level) of voluntary disclosures**
56 **on the credit rating of conventional banks, mainly in developed settings. Therefore,**
57 **our study extends this work by evaluating the possible effect of voluntary disclosure**
58
59
60

1
2
3 quality on Islamic and Conventional Banks' credit ratings in an under-researched
4 context of emerging economies. Likewise, we add to the debate on whether audit
5 quality as a proxy for disclosure quality can predict banks' credit ratings in emerging
6 and transitional economies.
7
8
9

10
11 Using 1590 bank-year observations of 29 Islamic and 77 conventional banks
12 across 17 MENA countries from 2006 to 2020, our findings suggest that voluntary
13 disclosure quality is significantly and positively associated with improving the credit
14 ratings of Islamic and conventional banks in the chosen emerging economies.
15 Specifically, the spread and usefulness of disclosed information have positive and
16 significant relationships with banks' ratings. In contrast, the quantity dimension of
17 voluntary disclosure is insignificantly associated with banks' credit ratings.
18 Additionally, audit quality is significantly attributed to Islamic banks' credit ratings
19 compared with an insignificant nexus documented among their conventional
20 counterparts.
21
22
23
24
25
26
27

28
29 Our empirical evidence has several implications for managers, lenders,
30 policymakers, regulators, and banking authorities in emerging and transitional
31 economies. For example, our evidence sheds light on the value and informativeness
32 of corporate voluntary disclosures for rating agencies to assess Islamic and traditional
33 banks' credit ratings in emerging economies. Therefore, our empirical results
34 encourage bank managers to voluntarily disclose more useful voluntary information
35 and ensure a high-quality audit to enhance their credit ratings. Our findings will
36 empower bank managers to provide more helpful information that enables their
37 customers and investors to make relevant financial decisions. Notably, our study
38 reiterates the critical need for more effective regulatory reforms to enhance the quality
39 of financial reporting (i.e., audit quality) in traditional banks to improve their credit
40 ratings compared with their Islamic counterparts.
41
42
43
44
45
46
47
48

49 Hence, our findings contribute significantly to the accounting and finance literature
50 on emerging economics. We urge the upcoming studies to contribute to this
51 contemporary literature in other contexts by examining the influence of other possible
52 contextual factors on the nexuses between credit ratings and audit quality. These
53 findings are worth integrating into the accounting and financial curriculum to motivate
54 the students to contribute more to the literature. Finally, our findings have empirically
55 supported the theoretical importance of disclosure and audit quality in enhancing
56
57
58
59
60

1
2
3 banks' credit ratings. Therefore, the practical applications of our findings are clear as
4 they provide a roadmap for bank managers and educators.
5

6 We also suggest that the regulators in these emerging economies utilize these
7 findings to implement or revise corporate reporting reforms effectively. Transparent
8 and high-quality disclosures promote investor trust in these economies, which leads
9 to higher bank credit ratings, financial stability, and economic growth. Hence, the
10 banks in these economies can offer various financial products and services for their
11 customers, potentially enhancing the quality of life and well-being of society.
12
13
14
15
16
17

18 Although our findings are robust in terms of various variables' measures and
19 endogeneity problems, the remaining limitations should be acknowledged. Firstly,
20 similar to other archival empirical research papers, the measures utilized for voluntary
21 disclosure quality, audit quality, and banks' credit ratings might or might not
22 represent actual performance. Therefore, future studies may be able to provide
23 additional insights by undertaking primary data techniques, such as in-depth case
24 studies and interviews. Secondly, our sample is restricted to 106 banks across 17
25 emerging economies from 2006 to 2020. Future studies will benefit from examining
26 the relationship between voluntary disclosure, audit quality, and bank credit rating in
27 both developed and developing countries. This broader sample will help uncover the
28 influence of the other possible contextual factors on the nexus between credit ratings
29 and audit quality.

CR1= measured as a dummy variable encoded 1 if the bank is rated between AAA to A- levels and 0 otherwise. CR2= measured by using a score between 1 for the lowest-rated bank to 7 for the highest-rated bank. Q_VD= stands for the quality of voluntary disclosure, Big4= is a dummy variable the takes the value of one if the largest four auditing firms audit the bank and zero otherwise, Co-audit= A dummy variable that takes 1 if a bank is audited by two audit firms and 0 otherwise, A-Opin= a dummy variable that takes 1 if auditor issued a going-concern opinion, and 0 otherwise, IAC= is measured as the number of independent directors on the audit committee scaled by the total number of audit committee members, ACZ= represents the size of the audit committee, ACM= stands for the total number of audit committee meeting held in a financial year, Bank-s= is measured as a natural logarithm of total assets, Growth= is calculated as the change in total assets scaled by the lag of total assets, LEVER= is measured as total liabilities divided by total assets, PROFIT= is calculated as net income scaled by the lag of total assets, LIQ= is measured as current assets scaled by current liabilities, CAP= represents capital adequacy ratio and is measured as the proportion of actual regulatory capital (Tier 1 capital) divided by the total assets, PT= is a dummy variable that takes the value of one if a bank is based in Egypt, Yemen, Syria, Tunisia, or Iraq and zero otherwise.

Q_STR= standardised relative quantity index for the bank i at year t . **Spread**= the average of the dispersion and the coverage of the information revealed by bank i at year t . **Usefulness**= based on the IFRS qualitative criteria, the degree of information revealed by bank i at year t . **Big4**= is a dummy variable that takes the value of one if the largest four auditing firms audit the bank and zero otherwise. **Co-audit**= A dummy variable that takes 1 if a bank is audited by two audit firms and 0 otherwise. **A-Opin**= a dummy variable that takes 1 if auditor issued a going-concern opinion, and 0 otherwise. **IAC**= is measured as the number of independent directors on the audit committee scaled by the total number of audit committee members. **ACZ**= represents the size of the audit committee. **ACM**= stands for the total number of audit committee meeting held in a financial year. **Bank-s**= is measured as a natural logarithm of total assets. **Growth**= is calculated as the change in total assets scaled by the lag of total assets. **LEVER**= is measured as total liabilities divided by total assets. **PROFIT**= is calculated as net income scaled by the lag of total assets. **LIQ**= is measured as current assets scaled by current liabilities. **CAP**= represents capital adequacy ratio and is measured as the proportion of actual regulatory capital (Tier 1 capital) divided by the total

assets, *PT*= is a dummy variable that takes the value of one if a bank is based in Egypt, Yemen, Syria, Tunisia, or Iraq and zero otherwise. *Bank-type*= is a dummy variable that assigns 1 to Islamic banks and 0 to conventional banks.

Appendix 1: Variables measurement and definition

	Symbol	Definition		Source
Dependent variables	CR1	is measured as a dummy variable encoded 1 if the bank is rated between AAA to A- levels and 0 otherwise.	Credit rating agencies (Fitch and Standards and Poor's)	Oh and Park., (2017) and Grassa et al., 2020
	CR2	is measured by using a score between 1 for the lowest-rated bank to 7 for the highest-rated bank.	Credit rating agencies (Fitch and Standards and Poor's)	Grassa et al., (2020); Hui et al., (2020); Oh and Park., (2017)
Independent variables	Q_VD	stands for the quality of voluntary disclosure	Annual reports	Salem et al., (2020) and Beretta and Bozzolan, (2008) and Alotaibi and Hussainey (2016)
	Big_4	is a dummy variable that takes the value of one if the largest four auditing firms auditing the bank and zero otherwise.	DataStream	Sahyoun and Magnan., (2020); Ahmadi and Bourl., (2019) and Zalata et al., (2020)
	Co-audit	A dummy variable that takes 1 if a bank is audited by two audit firms and 0 otherwise	DataStream/ Annual reports	Tepalagul and Lin, (2015) and Salem et al, (2021); Zerni et al., (2012)
	A-Opin	a dummy variable that takes 1 if the auditor issued a going-concern opinion and 0 otherwise.	Annual reports	Strickett & Hay, (2015); Siregar et al., (2020)
Control variables	IAC	is measured as the number of independent directors on the audit committee scaled by the total number of audit committee members,	DataStream/ Annual reports	Salem et al, (2021) and Tepalagul and Lin, (2015)
	ACZ	represents the size of the audit committee	DataStream/ Annual reports	Salem et al, (2020) and Salem et al, (2021)
	ACM	stands for the total number of audit committee meetings held in a financial year	DataStream/ Annual reports	Salem et al, (2020) and Salem et al, (2021)
	Bank-s	is measured as a natural logarithm of total assets	DataStream	Abdelsalam et al., (2016); Adams et al., (2003); Ahn et al., (2019) and Alali et al., (2012)
	Growth LEVER	is calculated as the change in total assets scaled by the lag of total assets, is measured as total liabilities divided by total assets,	DataStream DataStream	Alali et al., (2012); Salem et al, (2021) and Delis et al., (2021)
	PROFIT	is calculated as net income scaled by the lag of total assets	DataStream	Alali et al., (2012); Delis et al., (2021) and Abdelsalam et al., (2016)
	LIQ	is measured as current assets scaled by current liabilities	DataStream	
	CAP	represents capital adequacy ratio and is measured as the proportion of actual regulatory capital (Tier 1 capital) divided by the total assets	DataStream	Abdelsalam et al., (2016) and Delis et al., (2021)
	PT	is a dummy variable that takes the value of one if a bank is based in Egypt, Yemen, Syria, Tunisia, or Iraq and zeroes otherwise.	The Global Economy https://www.theglobaleconomy.com/rankings/wb_political_stability/MENA/	Abdelsalam et al., (2016) and Salem et al, (2021)
Bank-Type	is a dummy variable that assigns 1 to Islamic banks and 0 to conventional banks.	DataStream	Abdelsalam et al., (2016) and Salem et al, (2021)	

1
2
3 **Appendix A**
4

5 **Checklist of Voluntary disclosure (VD) categories and items:**
6
7
8
9

10 **1. Background about the bank / general corporate information (7):**

11 Brief narrative history of the Bank
12 Basic organization structure / chart / description of corporate structure
13 General description of business activities
14 Date of establishment
15 Official address / registered address / address for correspondence.
16 Web address of the bank / email address
17 Other background information

18 **2. Corporate Strategy (4):**

19 Management's objectives and strategies / corporate vision
20 Future strategy- general development of business.
21 Impact of strategy on future results
22 Other corporate strategy information

23 **3. Corporate Governance (18)**

24 Details about the chairman (other than name / title).
25 Details about directors (other than name / title).
26 Duties of board members.
27 Number of shares held by directors.
28 List of top five shareholders of the bank.
29 Number of shares held by managers.
30 Details of CEO's contact address.
31 Definition of independent directors.
32 Nature of chairman of the board of directors.
33 Directors' engagement / directorship of other companies.
34 Picture of all directors/board of directors.
35 Picture of chairperson only.
36 Information about changes in board members.
37 Number of board of members meetings held and date.
38 List of audit committee.
39 Chairman's statement.
40 CEO's statement.
41 Classification of managers as executive or outsider.

42 **4. Accounting Policies (8)**

43 Accounting valuation of fixed assets (e.g., fair value or historical cost).
44 The depreciation methods used.
45 Foreign currency transactions.
46 Events after the balance sheet date
47 Disclosure of accounting standards uses for its accounts
48 Statements of compliance with approved IFRS/IASs
49 Treatment of contingent liabilities
50 Other accounting policies

51 **5. Financial Performance (ratios) and other statistics information (16):**

52 Brief discussion of the bank's financial position
53 Disclosure on non-performing loans (NPLs) / Impaired loans
54 Analysis of bank's liquidity position
55
56
57
58
59
60

1	
2	
3	Return on assets (ROA)
4	Return on equity (ROE)
5	Liquidity ratios.
6	Earnings per share (EPS)
7	Capital adequacy ratios.
8	Total dividends.
9	Dividends per share for the period
10	Number of branches extension during the current fiscal year.
11	Financial statistics / financial highlights for more than one year
12	Comparative Income statement for 2 years.
13	Comparative balance sheet for 2 years.
14	Key achievement during the current year
15	
16	6. General Risk Management (7):
17	Discussion of overall risk management policy
18	Narrative discussions on risk assets, risk measurement.
19	Discussion on how risk are managed and controlled.
20	Information on risk management committee.
21	Information on assets-liability management committee.
22	Information on risk management structure.
23	Other information on risk management
24	
25	7. Credit Risk Exposure (7):
26	Disclosure on credit exposure
27	Information on credit risk management structure
28	Disclosures about the current loan.
29	Details of problem on loans and other assets.
30	Disclosure of credit rating system.
31	Disclosure about risk management process (use of risk-mitigating tools such as collaterals,
32	guarantees, netting agreement, managing concentrations).
33	Other information on risk exposure.
34	
35	8. Currency and market Risk (4):
36	Broken down by assets and liabilities.
37	Maturity of foreign currency assets and liabilities.
38	General descriptions of market risk segments.
39	Other information on market risk
40	
41	9. Liquidity Risk Exposure (3):
42	Information about the bank's available liquid assets as well as sources and uses of funds.
43	Maturity information about deposits and other liabilities.
44	Other information on liquidity risk
45	
46	10. Key Non-financial Statistics (7):
47	Details of branch location.
48	Number of branches.
49	Number of branch expansion during the year -2007.
50	Information on branch computerizations.
51	Information on ATM.
52	Location of ATM and their address.
53	Other non-financial information statistics
54	
55	11. Corporate Social Disclosure (5):
56	Sponsoring public health, sporting of recreational and social projects and education.
57	Information on donations to charitable.
58	Supporting national pride / government sponsored campaigns.
59	Information on social banking activities / banking for the society.
60	

Other corporate social disclosure.

12. Employee information (6):

Total number of employees.

Number of employees trained.

Policy on employees training.

Average compensation per employee.

Information on welfare of employees.

Other employee information

13. Others:

General voluntary disclosure information (e.g. On-line banking, international banking facilities, Information on credit card)

Appendix B: The Usefulness Dimension index

	<i>Depth of information disclosed</i>	<i>Operationalization</i>
Relevance	To what extent does the company use fair value instead of historical cost?	1 = Only historical cost 2 = Mostly historical cost 3 = Balance fair value / historical cost 4 = Most fair value 5 = Only fair value
	To what extent does the presence of non-financial information in terms of business opportunities and risks complement the financial information?	1 = No non-financial information 2 = Limited non-financial information, not very useful for forming expectations 3 = Sufficient useful non-financial information 4 = Relatively much useful non-financial information, helpful for developing expectations 5 = Very extensive non-financial information presents additional information which helps developing expectations
	To what extent does the risk section provide good insights into the risk profile of the company?	1 = No insights into risk profile 2 = Limited insights into risk profile 3 = Sufficient insights into risk profile 4 = Relatively much insights into risk profile 5 = Very extensive insights into risk profile
	To what extent does the annual report contain forward- looking information?	1 = No forward-looking information 2 = Limited forward-looking information 3 = Sufficient forward-looking information 4 = Relatively much forward-looking information. 5 = Very extensive forward-looking information
	To what extent does the annual report contain information on CSR?	1 = No information on CSR 2 = Limited information on CSR 3 = Sufficient information on CSR 4 = Very much information on CSR 5 = Very extensive information on CSR
	To what extent does the annual report contain disclosure of the extraordinary gains and losses?	1 = No proper disclosure 2 = Limited proper disclosure 3 = Sufficient proper disclosure 4 = Very much proper disclosure 5 = Very extensive proper disclosure
	To what extent does the annual report contain information regarding employee policies?	1 = No information regarding personnel policies 2 = Limited information regarding personnel policies 3 = Sufficient information regarding personnel policies 4 = Very much information regarding personnel policies 5 = Very extensive information regarding personnel policies
	To what extent does the annual report contain an analysis concerning cash flows?	1 = No analysis 2 = Limited analysis 3 = Sufficient analysis 4 = Very much analysis 5 = Very extensive analysis
	To what extent are the intangible assets disclosed?	1 = No disclosure 2 = Limited disclosure 3 = Sufficient disclosure 4 = Very much disclosure 5 = Very extensive disclosure

	To what extent are the "off-balance" activities disclosed?	1 = No disclosure 2 = Limited disclosure 3 = Sufficient disclosure 4 = Very much disclosure 5 = Very extensive disclosure
	To what extent is the financial structure disclosed?	1 = No disclosure 2 = Limited disclosure 3 = Sufficient disclosure 4 = Very much disclosure 5 = Very extensive disclosure
	To what extent does the annual report contain information concerning the bank's going concern?	1 = No information concerning going concern 2 = Limited information concerning going concern 3 = Sufficient information concerning going concern 4 = Very much information concerning going concern 5 = Very extensive information concerning going concern
	To what extent do the reported results provide feedback to users of the annual report as to how various market events and significant transactions affected the company?	1 = No feedback 2 = Little feedback on the past 3 = Feedback is present 4 = Feedback helps understanding how events and transactions influenced the company 5 = Comprehensive feedback
Faithful representation	To what extent are valid arguments provided to support the decision for certain assumptions and estimates in annual report?	1 = No valid arguments 2 = Limited valid arguments 3 = Sufficient valid arguments 4 = Very much valid arguments 5 = Very extensive valid arguments
	To what extent does the company base its choice for certain accounting principles on valid arguments?	1 = No valid arguments 2 = Limited valid arguments. 3 = Sufficient valid arguments 4 = Very much valid arguments 5 = Very extensive valid arguments
	Which type of auditor's report is included in the annual report?	1 = Adverse opinion 2 = Disclaimer of opinion 3 = Qualified opinion 4 = Unqualified opinion: financial figures 5 = Unqualified opinion: financial figures + internal control
	To what extent does the company provide information on corporate governance?	1 = No description of corporate governance 2 = Limited description of corporate governance 3 = Sufficient description of corporate governance 4 = Very much description of corporate governance 5 = Very extensive description of corporate governance
	To what extent does the annual report contain disclosure related to both positive and negative contingencies?	1 = No disclosure 2 = Limited disclosure 3 = Sufficient disclosure 4 = Very much disclosure 5 = Very extensive disclosure
	To what extent does the annual report contain information concerning bonuses of the board of directors?	1 = No information concerning bonuses 2 = Limited information concerning bonuses 3 = Sufficient information concerning bonuses 4 = Very much information concerning bonuses. 5 = Very extensive information concerning bonuses
	Understand ability	To what extent is the annual report presented in a well organized manner?

		4 = Good presentation 5 = Very good presentation
	To what extent does the presence of graphs and tables clarify the presented information?	1 = No graphs and tables. 2 = 1-5 graphs 3 = 6-10 graphs 4 = 11-15 graphs 5 = > 15 graphs
	To what extent is the use of language and technical jargon in the annual report easy to follow?	1 = Very much jargon 2 = Much jargon 3 = Moderate use of jargon 4 = Limited use of jargon 5 = No/hardly any jargon
	What is the size of the glossary?	1 = No glossary 2 = Less than 1 page 3 = Approximately 1 page 4 = 1-2 pages 5 = > 2 pages
	To what extent does the annual report contain information concerning mission and strategy?	1 = No information concerning mission and strategy 2 = Limited information concerning mission and strategy 3 = Sufficient information concerning mission and strategy 4 = Very much information concerning mission and strategy 5 = Very extensive information concerning mission and strategy
	To what extent is the annual report understandable in the perception of the researcher?	1 = Very badly understandable 2 = Badly understandable 3 = Poorly understandable 4 = Good understandable 5 = Very good understandable
	To what extent are the notes to the balance sheet and the income statement sufficiently clear?	1 = No explanation 2 = Very short description, difficult to understand 3 = Explanation that describes what happens 4 = Terms are explained (which assumptions etc.) 5 = Everything that might be difficult to understand is explained
Comparability	To what extent are changes in accounting policies disclosed?	1 = No disclosure 2 = Limited disclosure 3 = Sufficient disclosure 4 = Very much disclosure 5 = Very extensive disclosure
	To what extent are changes in accounting estimates disclosed?	1 = No disclosure 2 = Limited disclosure 3 = Sufficient disclosure 4 = Very much disclosure 5 = Very extensive disclosure
	To what extent does the company provide a comparison of the results of current accounting period with previous accounting periods?	1 = No comparison 2 = Only with previous year 3 = With 5 years 4 = 5 years + description of implications 5 = 10 years + description of implications
	To what extent does the company present financial index numbers and ratios in the annual report?	1 = No ratios 2 = 1-5 ratios 3 = 6-10 ratios 4 = 11-15 ratios 5 = > 15 ratios

	To what extent does the annual report contain information concerning companies' shares?	1 = No information concerning companies' shares 2 = Limited information concerning companies' shares 3 = Sufficient information concerning companies' shares 4 = Very much information concerning companies' shares 5 = Very extensive information concerning companies' shares
	To what extent did the company adjust previous accounting period's figures, for the effect of the implementation of a change in accounting policy or revisions in accounting estimates?	1 = No adjustments 2 = Described adjustments 3 = Actual adjustments (one year) 4=2years 5=>2years+notes
Timeliness	How many days did it take for the auditor to sign the auditors' report after book year end?	Natural logarithm of amount of days 1 = 1- 1.99 2 = 2-2.99 3 = 3-3.99 4 = 4-4.99 5 = 5-5.99

Journal of Accounting in Emerging Economies

Credit Confidence: The Impact of Disclosure Quality and Audit Quality on Bank Ratings in Emerging Economies / JAEE-04-2024-0181

Dear Editor,

A Report of Amendments and Responses to the Reviewers' Comments

The authors would like to thank you for forwarding the reviewers' comments to us and for allowing us to revise and resubmit the paper. We would also like to thank the two anonymous reviewers for their insightful and constructive comments, which have enabled us to revise the article, and in doing so, improve its overall quality. We specify below in detail the changes that have been carried out, by us, in response to each of the reviewers' comments.

No	Reviewer- 1	Authors' response
1	<p>Motivation</p> <p>1. I think the motivation for the paper can be significantly improved. The authors do not provide a convincing argument of the contribution that their study makes. Examining the relationship between banks credit ratings and disclosure quality has been done in many settings and the results are pretty much overwhelming in one direction. That is, that disclosure is positively associated with banks credit ratings. If the authors argue that examining this in the MENA countries is the contribution that they hope to make, then they need to provide a more convincing argument as to why this is worth examining and also why the results that hold in other developed economies are unlikely to hold in this region. This is important given that the authors argue that banking in the MENA region bears some semblance to banking in developed economies. In other words, for this not to be a straight replication of a result that is widely accepted in the literature, the authors have to show why they expect to find something different.</p>	<p>Thanks for your valuable feedback. In line with your comments, we have rewritten the introductory section of our work to ensure that we provide convincing arguments on the motivations and contributions of our study.</p> <p>For instance, on pages 3&4, we distanced our study from earlier studies by emphasising the unique role of non-conventional (informal) institutions in influencing firms' disclosure practices in the MENA region. We also clarified our study's motivations.</p>
2	<p>2. Second, the introduction of audit quality as a variable of interest in a multi-country setting appears ad hoc. If prior studies show that audit quality as a proxy for mandated disclosure quality, impacts credit ratings, what is the argument for a multi-country study. Are there differences in the audit setting among these countries that warrants such an examination? The authors need to flesh out the motivation for this question.</p>	<p>We appreciate these very important comments and have revised our work by highlighting differences in audit settings and the impact of culture on the audit practices of firms in the MENA region (see pages 3&4).</p>

3	<p>3. The authors also examine the impact of audit opinion on credit ratings. When a firm receives a going-concern opinion, more than likely, its credit rating will go down. Even if we consider the reverse, i.e. a firm that receives a credit rating downgrade, the expectation is that this firm will experience an increase in its borrowing costs which can lead to going concern problems. In other words, the authors must do a better job of telling the reader why this question is important. See for example Strickett et al. (2022) that already documents these results.</p>	
4	<p>4. In all the arguments and analysis, I do not see a convincing case made for the difference between Islamic and non-Islamic banks. In other words, if the expectation is that both banks act similar to each other, the authors have to provide a rationale for why they are examined differently. I agree that the differential examination is important, but the authors have not properly provided a justification for why we should be interested in this.</p>	<p>This solid comment is taken into account, and amendment/ justification can be found on page 20.</p> <p><i>“The operational and governance frameworks of Islamic and conventional banks exhibit substantial differences, especially regarding the disclosure and audit practices (Salem et al. 2021). IBs operate under Shariah rules, which mandate ethical responsibilities for their financial activities (Elnahass et al. 2014), affecting both the quality of their disclosures and their auditing techniques (Abdallah et al. 2015). In contrast to traditional banks, which promote financial disclosure aimed at maximizing shareholder value, IBs are also required to adhere to religious and ethical standards (Lassoued et al, 2018; Farook et al. 2014). This results in greater transparency and enhances voluntary disclosure, particularly concerning governance and social responsibility (Farook et al., 2014). Additionally, IBs engage in dual audits: one for financial reporting and another for Shariah compliance, regulated by Shariah supervisory boards. The audit quality in IBs is consequently more stringent since it integrates both financial efficiency and compliance with religious norms (Grassa, 2015). The incorporation of external auditors, including Big-4, and the integration of ethical auditing procedures enhance the overall audit quality in IBs compared to their conventional counterparts (Salem et al., 2021). The unique governance processes of IBs foster the perception of them as more risk-averse</i></p>

		<p><i>and ethically accountable, underscoring the necessity for a comparative analysis between IBs and NIBs in research concerning financial reporting, governance, and credit ratings.”</i></p>
5	<p>5. Another issue that needs to be resolved is the nature of the information that is being analyzed. The authors argue, citing prior literature, that voluntary disclosures are mostly narrative and private in nature and has been shown to affect credit ratings. However, the information that is being disclosed and analyzed is not private in nature. This is public information obtained from a firm’s public disclosure. While the argument can be made that negative public disclosures move credit ratings more than negative private information (see for example, Vanhaverbeke et al. 2024) this is not the arguments that the authors are making.</p>	<p>We appreciate the reviewer’s insightful comment regarding the nature of the information being analysed. While we initially referred to voluntary disclosures as predominantly narrative and private in nature, we recognize that in the context of our study, the information is public, obtained from firms' publicly disclosed statements. To address this, we revised our discussion to clarify that the voluntary disclosures in this study are public. Amendments can be found on pages 6&7.</p> <p><i>“Because voluntary disclosures are mostly narrative and public in nature, accuracy and certainty are critical to avoid disclosures becoming boilerplate and losing their value (Bozzolan and Miihkinen, 2021). Previous literature indicates that voluntary disclosure quality is an important mechanism through which management can affect credit ratings (Akorsu, 2023; Basu et al., 2022; Cao et al., 2024; Crabtree & Maher, 2012; Elamer et al., 2020; Grassa et al., 2020; He, 2018; Oh & Park, 2017). According to Vanhaverbeke et al. (2024), public disclosures generally impose a more significant influence on credit ratings than private information, since credit analysts are likely to prioritise unfavourable public information when modifying their risk evaluations. This underscores that public disclosures can substantially impact credit ratings more than private disclosures. High-quality public disclosures are expected to associate positively with credit ratings, highlighting the significance of transparency and accuracy in the information presented. Similarly, DeBoskey and Gillett (2013), He (2018), and Elamer et al. (2020) underscore the essential function of comprehensive</i></p>

		<i>public disclosures in improving enterprises' creditworthiness and analysts' risk evaluations."</i>
6	6. Related to 5 above, in the coding of disclosures, the authors have coded all items as either present or absent. I am a bit concerned that this coding scheme fails to account for the fact that an item that is present may have a differential impact on a firm's credit rating depending on the nature of the actual disclosure. For example, item #6, two firms that make disclosures in response to the questions in that item, may have a differential credit rating impact depending on whether the answers are positive or negative. In other words, quantity may not matter as much as content.	<p>Thank you for your insightful comment. We agree that the impact of disclosures on a firm's credit rating may depend on the nature of the content, not merely its presence or absence. Our measurement framework addresses this concern by incorporating both quantitative and qualitative aspects of disclosure, as outlined in Section 4.3.3 on the Usefulness dimension. Specifically, we evaluate the quality of information disclosed by using IFRS qualitative characteristics such as faithful representation, understandability, relevance, comparability, and timeliness, which capture the differential impact of disclosure content on stakeholders. Amendments can be found on pages 15&16.</p> <p><i>"To address the potential varying effects of revealed items on corporate credit ratings, we go beyond a binary coding technique. Alongside categorizing the existence or absence of disclosure items, we evaluate the quality of the given information based on the IFRS qualitative attributes of faithful representation, understandability, relevance, comparability, and timeliness (IFRS 2010; Salem et al., 2020). This multi-faceted strategy guarantees that the substance and nature of disclosures are sufficiently documented, illustrating their potential influence on stakeholder views, including credit ratings. By incorporating both quantitative and qualitative characteristics, we guarantee a thorough assessment of voluntary disclosures. To measure the usefulness dimension, we adopted Salem et al.'s (2020) index with a rating scale of five points (see Appendix B). However, timeliness is obtained through the natural logarithm of the number of days between the year-end and the auditor's signature. Consistent with</i></p>

		<p><i>Alotaibi and Hussainey (2016) and Salem et al. (2020), we employed the weighted technique of the qualitative characteristics as follows:</i></p> $USE_FU = \frac{1}{5} (\text{Faithfulness} + \text{Understandability} + \text{Relevance} + \text{Comparability} + \text{Timeliness})$
7	<p>Research design</p> <p>1. In the lead up to H1, the authors mention transparent and high-quality disclosure. What is transparent disclosure? What is high quality disclosure? Do both mean the same thing? I think the authors should be a bit more precise in the terms that they use and how these are measured.</p> <p>2. In your estimation of Q_STR I have a few points that you may want to consider:</p> <p>a. The authors say that OLS regression was employed to estimate the quantity dimension proxy. How was this OLS estimated?</p> <p>b. Please describe how you estimated R_Q.</p> <p>c. Bank type and complexity do not appear to me to be similar based on the arguments in the paper.</p> <p>d. It also appears to me that there is a mixture of overall sample variables and firm sample variables in the estimation. I cannot see why you have the firm subscript for all items in the estimation of Q_STR. Given what you have, certain values of Q_STR will be undefined when Max_R_Q=R_Q.</p> <p>3. The authors state that panel regression is used to estimate the regression equations. CR1 and CR2 are not continuous variables. Does the panel regression technique account for the nature of the dependent variable? Is this a logit panel regression for CR1 for instance?</p>	<p>1-Thank you for your comment regarding the terms "transparent disclosure" and "high-quality disclosure." We recognize the need to be more precise in our definitions of these concepts. In our study, transparent disclosure refers to the clarity of the information provided, ensuring that stakeholders, particularly investors and rating agencies, can easily access and interpret the disclosed data. On the other hand, high-quality disclosure encompasses not only the clarity and accessibility of the information but also the usefulness and reliability of the content. While both terms overlap in certain respects, high-quality disclosure extends beyond transparency by ensuring that the information is accurate, relevant, and provided in a timely manner, thus enabling more informed decision-making by stakeholders. To address this in the manuscript, we refine the terms and ensure that "transparent disclosure" is used when referring to the clarity of information, while "high-quality disclosure" will refer to the broader qualitative assessment of the information provided. Please see pages 7&8.</p> <p>2- (a)- Thank you for your comment. We appreciate the opportunity to clarify the OLS estimation process for the quantity dimension proxy (Q_STR). We employed OLS regression to estimate the quantity of disclosure by controlling for bank size and type, as these factors significantly influence disclosure levels (Rezaee & Tuo, 2019; Salem et al., 2020). Specifically, the OLS</p>

	<p>regression was used to compute the residuals (R_{Qit}), representing the anticipated transparency of each bank. The standardized formula for Q_STR is derived by adjusting for these residuals, ensuring that the variation in size and type is accounted for. A footnote has been added on page 14 to address this point.</p> <p>2- (b) R_Q, the relative quantity index, was estimated using OLS regression. We modelled the level of voluntary disclosure as a function of bank-specific characteristics, specifically bank size and type. The residuals (R_{Qit}) from the OLS regression capture the difference between the observed and expected levels of disclosure for each bank-year observation. These residuals represent the unanticipated or relative disclosure quantity, adjusting for the influence of size and type. We then used these residuals in the standardization formula to calculate Q_STR, the standardized relative quantity index. A footnote has been added on page 14 to address this point.</p> <p>2- (c) To clarify this point, following Rezaee & Tuo, (2019) & Salem et al., (2020), bank type refers to whether a bank is Islamic or conventional, which influences its reporting practices and regulatory environment. On the other hand, complexity pertains to the size of the bank, which can affect the scope of its disclosures.</p> <p>2- (d) Thank you for pointing out the potential confusion regarding the subscripts and the mix of overall sample variables and firm-specific variables in the estimation of Q_STR. We acknowledge that the inclusion of the firm subscript for all items in the formula may have led to ambiguity. To address this, we revised the equation and add more clarification which can be found on page 14.</p>
--	---

		<p>3- Thank you for your insightful comment regarding the estimation technique. Although we adopted these techniques to ensure the panel regression method aligns with the nature of the dependent variables, we regret that we failed to include this explanation in the initial manuscript. We have now revised the text to clarify these methodological details. Please see pages 19&20</p> <p><i>“Our analysis employed two types of credit rating measures as dependent variables: a seven-category credit rating scale (ordinal) and a binary indicator for investment grade (Grassa et al., 2020; Oh and Park 2017). We utilised an ordered logit panel regression model for the ordinal measure to accommodate the ordered characteristics of the credit rating variable (CR2). We employed a logit panel regression model for the binary classification (CR1), suitable for dichotomous outcomes (Grassa et al., 2020). These models guarantee that the statistical methods correspond with the characteristics of the dependent variables, therefore yielding robust and dependable results.”.</i></p>
Minor Points		
8	<p>1. The authors state in the lead up to H2 that big 4 auditors consider the credit ratings while giving their opinions. This is an empirical question for which no evidence is provided. If this is a prior finding, please provide a citation.</p>	<p>Thank you for your observation regarding the statement about Big 4 auditors considering credit ratings while giving their opinions. We acknowledge that this is an empirical question that requires proper citation. We have now included the relevant citation to support this statement, as shown on page 9 of the revised manuscript. We appreciate your feedback and believe this addition strengthens the validity of our hypothesis.</p> <p><i>“Based on this argument, we expect a positive relationship between big 4 auditors and credit ratings as big 4 auditors</i></p>

		consider the credit ratings while giving their opinions (Strickett et al., 2022)". Please see page 9 &10
9	2. The writing in the paper can be significantly improved. There are a number of typographical errors and incomplete sentences in the paper. For example, on p.4 the sentence "Second, the Western roots in MENA countries." Appears to be incomplete. On p.7 the sentence "Audit reputation is associated with a better voluntary disclosure quality and diminishing the information asymmetries between ..." appears to be grammatically wrong. H3 – Therefore, we hypothesis... "emphasise" on p. 13 in the description of DISP_E. It appears that the paper will benefit from copy editing.	<p>We thank the reviewer for identifying these areas that need improvement in the writing quality. We have carefully reviewed the manuscript to address typographical errors, incomplete sentences, and grammatical issues. The specific examples noted, such as the incomplete sentence on p.4, the grammatical issue on p.7, the phrasing in H3, and the use of "emphasise" in the DISP_E description on p.13, have all been corrected. Additionally, we have undertaken a thorough copy-editing process to enhance clarity, coherence, and readability throughout the paper.</p> <p>We appreciate the reviewer's attention to detail and believe these revisions have strengthened the manuscript's overall presentation.</p>
10	3. I think you should exercise adequate care in writing the formulae for your variables. I note that there may be errors in the equations for your variable descriptions in addition to (2) above. For instance, in your formula for COV_E what does the "t" stand for. Also, the firm variable "I" is missing on the right-hand side of the equation.	<p>Thank you for your valuable feedback regarding the formulae. We have carefully reviewed and revised the variable descriptions and equations in the manuscript to ensure clarity and accuracy (see pages 14, 15 & 16)</p>
11	4. It appears that the variable A-Opin is missing from your equation 1.	<p>Thank you for your feedback. We would like to clarify that Equation 1 includes A_Q, which represents the audit quality proxies, as defined in Appendix 1. These proxies consist of Big_4, Co-audit, and A-Opin. The variable A-Opin is indeed accounted for within A_Q, and we have ensured that this is clearly stated in the manuscript. (See page 18)</p>
12	5. I am a little confused as to the direction of causality in the paper. In the prelude to H1, the authors argue that high credit ratings drive more disclosures which suggests that the disclosure is the DV but in the tests, credit rating is	<p>We appreciate the reviewer's observation on the direction of causality in Hypothesis 1 (H1). To clarify, our hypothesis posits that high-quality voluntary disclosure positively influences credit</p>

ratings, making credit rating the dependent variable in our analysis. We have revised the prelude to H1 to explicitly frame voluntary disclosure quality as the independent variable that influences credit ratings. The revised H1 now reads: "High-quality voluntary disclosure positively influences the credit rating of both Islamic and non-Islamic banks."

Specifically, **on page 8**, we state the following:

Thus, we argue that high-quality voluntary disclosure (characterized by transparency and completeness) enables credit rating agencies to better assess a bank's risk, which can positively affect the bank's credit rating. This aligns with agency theory, where increased transparency through high-quality disclosures helps reduce informational conflicts among stakeholders and thereby fosters better credit ratings. Based on this argument and the findings of related prior studies (e.g., DeBoskey & Gillett, 2013; He, 2018; Heflin et al., 2011), we hypothesize that higher-quality voluntary disclosure, which encompasses both transparent and comprehensive information, is positively associated with a bank's credit rating. Hence, we formulate the following hypothesis:

H₁ = *High-quality voluntary disclosure positively influences the credit rating of both Islamic and non-Islamic banks.*

This adjustment should resolve any ambiguity and better align the hypothesis with our testing approach, which positions credit rating as the outcome variable affected by the quality of voluntary disclosure. Thank you for this valuable feedback.

13	<p>6. How do your results encourage managers to voluntarily disclose more useful non-financial information? Your disclosure measure is a mix of financial and non-financial information so how do you isolate only non-financial. It appears to me that your disclosure measure is more along the lines of the quantity of disclosure.</p>	<p>Thank you for your insightful comment regarding the use of non-financial information in our disclosure measure. We acknowledge that our disclosure measure includes both financial and non-financial information. To address this, we have revised the terminology for consistency on the third paragraph of the conclusions (page 27), referring to it as corporate voluntary disclosures. Our focus is on both the extent and quality (usefulness) of these disclosures. We believe this clarification aligns with your feedback and enhances the coherence of our manuscript.</p> <p><i>“For example, our evidence sheds light on the value and informativeness of corporate voluntary disclosures for rating agencies to assess Islamic and traditional banks’ credit ratings in emerging economies. Therefore, our empirical results encourage bank managers to voluntarily disclose more useful voluntary information and ensure a high-quality audit to enhance their credit ratings. Our findings will empower bank managers to provide more useful information that enables their customers and investors to make relevant financial decisions.”.</i></p>

Reviewer- 2		

15	<p>1. Originality: Does the paper contain new and significant information adequate to justify publication?: This manuscript seeks to investigate the influence of the quality of disclosed financial and non-financial information on the credit ratings of banks in emerging economies.</p> <p>The paper contain new and significant information adequate to justify publication. However, based on the discussions in the introduction, the gap in the existing literature that prompted this study is not clearly articulated. In my opinion, the introduction is generally well written. However, the authors should better clarify the contribution and the objectives of the paper. Make sure that you stress "What do we learn that we did not know"</p> <p>The introduction needs more on the motivation of the study, which is practically not well supported.</p>	<p>Thanks for your suggestions. To address your comment, we have carefully rewritten the introductory section of our work to ensure that we provide convincing arguments on our study's motivations, objectives and contributions (See pages 3&4).</p>
16	<p>2. Relationship to Literature: Does the paper demonstrate an adequate understanding of the relevant literature in the field and cite an appropriate range of literature sources? Is any significant work ignored?: The paper demonstrates an adequate understanding of the relevant literature but the authors should cite additional literature sources. The paper certainly has the potential to add value to the literature; however the authors should enhance it accordingly.</p>	<p>Thank you for your constructive feedback regarding the relationship to the literature. We have addressed your comments by incorporating additional recent references to ensure a comprehensive understanding of the relevant literature in our field. These new citations enhance the depth and breadth of our literature review, ensuring that no significant work is overlooked. We believe these enhancements strengthen our paper's contribution to the existing body of knowledge and align with your suggestions for improvement. See pages 2-3 and 5-7</p>
17	<p>3. Methodology: Is the paper's argument built on an appropriate base of theory, concepts, or other ideas? Has the research or equivalent intellectual work on which the paper is based been well designed? Are the methods employed appropriate?: The paper's argument is built on an appropriate base of theory and concepts. I appreciate the method approach you are applying to study your phenomenon. However the authors need to better clarify the methodology used in this paper.</p>	<p>Thank you for your insightful feedback. We appreciate your acknowledgement of the theoretical and conceptual foundation of the paper. In response to your comment regarding the methodology, we have taken steps to further clarify the research design and methodological approach. Specifically, we have elaborated on the data collection process, sample selection, and variables used in the study, as well as the justification for applying our chosen statistical methods. See pages 12 , 18, 19 and 20</p>

18	<p>4. Results: Are results presented clearly and analysed appropriately? Do the conclusions adequately tie together the other elements of the paper?: The authors have maintained good level of statistical rigor. The conclusions do not adequately tie together the other elements of the paper</p>	<p>Thanks for your comments. We have rewritten the conclusion to ensure it reflects the key issues covered in the paper (See pages 26 & 27).</p>
19	<p>5. Implications for research, practice and/or society: Does the paper identify clearly any implications for research, practice and/or society? Does the paper bridge the gap between theory and practice? How can the research be used in practice (economic and commercial impact), in teaching, to influence public policy, in research (contributing to the body of knowledge)? What is the impact upon society (influencing public attitudes, affecting quality of life)? Are these implications consistent with the findings and conclusions of the paper?: More implications can be added based on your results. I suggest that better clarification in terms of discussion implications will make paper more consistent and coherent.</p>	<p>Thank you for your detailed feedback on the implications section of our manuscript. We have carefully revised this section to provide a clearer and more comprehensive discussion of the implications for research, practice, and society. Specifically, we have expanded on how our findings bridge the gap between theory and practice, and we have articulated the potential economic and commercial impacts, contributions to teaching, influence on public policy, and societal benefits, as shown in the fourth and fifth paragraphs of the conclusions section (pages 27 & 28). We believe these enhancements make our paper more consistent and coherent, aligning with your suggestions for improvement.</p> <p><i>“Hence, our findings are significant in the accounting and finance literature in the context of emerging economics. We urge the upcoming studies to contribute to this contemporary literature in other contexts by examining the influence of other possible contextual factors on the nexuses between credit ratings and audit quality. These findings are worth integrating into the accounting and financial curriculum to motivate students to make more contributions to the literature. Finally, our findings have empirically supported the theoretical importance of disclosure and audit quality in enhancing the credit ratings of banks. Therefore, the practical applications of our findings are clear as they provide a roadmap for bank managers and educators. We also suggest that the regulators in these emerging economies utilize these findings in the effective implementation or revision</i></p>

		<i>of corporate reporting reforms. The transparent and high-quality disclosures promote investor trust in these economies, which leads to higher credit ratings of the banks, financial stability, and higher economic growth. Hence, the banks in these economies can offer a variety of financial products and services for their customers, potentially enhance the quality of life and well-being of the society”.</i>
20	6. Quality of Communication: Does the paper clearly express its case, measured against the technical language of the field and the expected knowledge of the journal's readership? Has attention been paid to the clarity of expression and readability, such as sentence structure, jargon use, acronyms, etc.: Professional English language copy editing is highly advised before resubmission.	Thanks for your comments, have thoroughly proofread the manuscript and ensured that all sections adhere to a high standard of professional English
