# Factors affecting the selection of effective cost control techniques in the UK construction industry

## Abstract

**Purpose** - This paper aims to identify and analyse the factors affecting the selection of effective cost control techniques in the UK construction industry and assess their importance. The study examines these key areas; (i) the factors that have significant impacts on cost overruns, (ii) the most effective cost control techniques, and (iii) the factors for selecting cost control techniques for a project.

**Design/methodology/approach** - The study relies on a mixed-method research approach; a qualitative exploration of the most effective cost control techniques and the factors affecting the selection of cost control techniques, followed by a questionnaire survey and follow-up interviews. Relative Importance Index (RII) is used for ranking the factors.

**Research limitations/implications** - Although the scope of the study was limited to the UK construction industry, the results could be interpreted for critical learning in other developed/developing countries.

**Findings** - Budgeting technique is ranked first with-0.821RII, followed by cost forecasting-0.800RII and cashflow monitoring-0.733RII, as the most effective cost control techniques. On factors that influenced the choice of the techniques used, cost information/cost-related factors is ranked first with-0.611RII, followed by the size of the company-0.509RII and the effectiveness of the technique-0.572RII.

**Originality/value** – Identifying and ranking the factors affecting the selection of effective cost control techniques in the UK construction industry has been the focal point of this study. The study also proposes a simple but effective model that can be used for critical learning on mitigating cost overruns and the effective use of cost control techniques in the construction industry.

**Keywords:** cost control techniques, construction projects, cost overruns

## 32 Introduction

33 Construction projects have three main aims; projects delivered on time, within budget, and  
34 to the necessary quality (Potts, 2013). The problems associated with cost overruns cannot  
35 be over-emphasised. A study by UK [Construction Media](#) indicates in the three years to  
36 2015, less than one in three projects (31%) came within 10% of the originally planned  
37 budget (UK Construction Media 2017). A good example is [the](#) Wembley stadium where the  
38 cost of the project rose by 36% between the bid being accepted and the contract being  
39 signed. The stadium was “mired in controversy with questions over adequate cost planning  
40 and budget management” (Kirkham, 2015). The cost was expected to be approximately  
41 £200 million and the final project cost was £757 million. This could have been [due](#) to the  
42 failure of budget management (Kirkham, 2015). The cost overrun of [the](#) Scottish  
43 parliament [was](#) staggering, the planned cost was £50m and the final cost was £414m an  
44 increment of 730% (Global Construction Review, 2019). Due to the slender profit margins  
45 in the construction industry (2% to 7%), without adequate cost control techniques,  
46 substantial risk of cost overrun due to liquidated damages and delay is placed on the  
47 contractor (Oyegoke and Kiyumi, 2017).

48 The HS2 ([High-Speed Railway](#)) an ongoing project in the UK is a recent example, the  
49 expected final cost of the project is to be £56 billion, [which](#) is up 71% on the first estimate  
50 of £32.7 billion in 2010 (BBC, 2018). Although the reasons could be put down to poor cost  
51 planning at the planning stage and design stages, it is during the construction stage that  
52 the costs spiral out of control. According to Jayaraman (2016) and Oyegoke (2003), large  
53 projects can easily have cost overruns of several millions. Ensuring the project is within  
54 budget is crucial to the project's success.

55 Selecting the most effective cost control techniques is vital to [the](#) overall cost control  
56 mechanism. It is evident [from the study carried out by Olawale and Sun \(2010\)](#) that many

1  
2  
3 57 companies simply develop their own techniques from an individual's experience of what  
4  
5 58 methods have been most effective for them. In turn, many different techniques are utilised  
6  
7 59 within the industry, making it hard to establish which technique is most effective. There is  
8  
9  
10 60 no 'set-in stone' technique that is viewed by all as [the](#) most effective (Jayaraman, 2016). A  
11  
12 61 cost control system can be described as an overall approach a company takes to  
13  
14 62 controlling costs. Cost systems, for instance, include life cycle costing, [Kaizen](#) costing,  
15  
16 63 building information modelling ([BIM](#)), and traditional costing systems (Omotayo, 2017). All  
17  
18 64 the cost control systems have their merits in controlling costs, but this study focuses on the  
19  
20 65 factors used to make the cost control systems successful. Ranking the factors and the  
21  
22 66 techniques is more important since techniques are often used across all the cost control  
23  
24 67 systems.

25  
26  
27  
28  
29 68 The aim of this paper is to examine the most effective cost control techniques and the  
30  
31 69 factors that affect the selection of cost control techniques in construction projects in the  
32  
33 70 UK. [The issue on cost overruns and controlling cost overruns has been a popular topic in](#)  
34  
35 71 [academic literature since the 1980s. Many authors such as Chan and Kumaraswamy](#)  
36  
37 72 [\(1997\); Jackson \(2002\); Olawale and Sun \(2010\); Memon et al. \(2011\); Park and](#)  
38  
39 73 [Papadopoulou \(2012\); Rosenfeld \(2013\) have conducted research on identifying the](#)  
40  
41 74 [factors affecting project cost overruns. However, the research carried out on identifying the](#)  
42  
43 75 [effective cost control techniques to date is subject to a number of limitations. Olawale and](#)  
44

1  
2  
3 82 critical learning on mitigating cost overruns and the effective use of cost control techniques  
4  
5  
6 83 in the construction industry. This research utilises primary data as defined by Farrell  
7  
8 84 (2016) and relies on a questionnaire survey that utilised both open and closed questions  
9  
10 85 producing quantitative and qualitative results. A pilot study was undertaken to ensure that  
11  
12 86 the questionnaire is to the highest quality and easily understood by the participants.  
13  
14 87 Additionally, 3 follow-up interviews were carried out to allow for a greater insight into the  
15  
16 88 information provided. Thematic analysis is used to develop-identify themes across the  
17  
18 89 dataset to develop a conceptual model to identify the challenges for monitoring and  
19  
20 90 controlling costs, factors with significant impacts, and the most effective techniques.  
21  
22  
23

24 91 The general design of the study is to determine the challenges faced in monitoring and  
25  
26 92 managing cost control, and the most appropriate techniques used to mitigate the  
27  
28 93 challenges. It also examines the impacts of standardisation and digitisation in cost control  
29  
30 94 and proposed a solution. The study was carried out in the UK with wider cost control and  
31  
32 95 techniques application in different practices.  
33

## 40 98 **Controlling costs in construction projects**

41  
42 99 Controlling costs in construction projects to ensure the cost objectives are met has always  
43  
44 100 been essential to any project's success. According to Ashworth and Perera (2015), in  
45  
46 101 recent years there has been a need for a better understanding of cost control from both  
47  
48 102 the client and contractor's perspectives. Cost overrun problem is affected by many factors  
49  
50 103 which may include; psychological biases in estimating and monitoring costs, political  
51  
52 104 intervention in decision-making, geological and weather conditions, contractor's profit  
53  
54 105 margins being reduced, environmental aspects such as greater elimination of waste and  
55  
56 106 more consideration on the environment, economic recession producing a shortage of  
57  
58  
59  
60

1  
2  
3 107 funds available, high inflation and higher interest rates leading to construction prices  
4  
5 108 soaring, etc. (Mansfield *et al.* 1994; Jergeas, 2008; Cantarelli *et al.*, 2010; Ahiaga-Dagbui  
6  
7 109 and Smith, 2014). These factors, together with a greater trend towards producing cost  
8  
9 110 efficiencyies and the availability of better tools and techniques, have led to greater  
10  
11 111 importance being placed upon controlling costs as well as expecting more accurate results  
12  
13 112 (Olawale and Sun, 2010). Seeley-(1996), emphasises the importance of cost control,  
14  
15 113 labelling cost management as the single most important role undertaken by a Quantity  
16  
17 114 Surveyor (QS).

18  
19  
20  
21  
22 115 An extensive review of the literature was carried out to identify and categorised cost  
23  
24 116 overrun factors into nine (9) broader themes of price and cost, delay and extension of time,  
25  
26 117 project management, design issues, construction issues, payments, contractor specific  
27  
28 118 factors, consultants' specific factors, and force majeure. In total, 35 cost overrun factors  
29  
30 119 were identified as shown in Table 1.

31  
32  
33  
34 120

### 35 36 37 121 **Insert - Table 1. Cost Overrun Factors**

### 38 39 122 40 123 **Cost control techniques - challenges of implementing effective cost** 41 42 124 **controls**

43  
44 125 The three main aims of cost control are to give the employer value for money, distribute  
45  
46 126 logically available funds between various parts of the building, and to keep the costs within  
47  
48 127 the employer's budget (Seeley, 1984). A good cost control should ensure that the funds  
49  
50 128 available are allocated effectively to various elements, ensure that the tender figure is as  
51  
52 129 close as possible to the first estimate, and achieve good value at the desired level of  
53  
54 130 expenditure (Kirham, 2015). Ashworth and Perera (2015), postulate that the purpose of  
55  
56 131 cost control is to limit the client's expenditure to the desired amount, achieve a balanced  
57  
58 132 design expenditure between the elements of the building, and to provide value for money.

1  
2  
3 133 Bergerud (2012)<sub>1</sub> believes the main challenge faced when implementing cost control is  
4  
5 134 controlling the costs. Indicating that merely monitoring and reporting can easily be done.  
6  
7

8 135 Jayaraman (2016), believes that the reasons for difficulties in controlling costs lies in the  
9  
10 136 difficulty of estimating a budget. He concludes that even with knowledge of common cost  
11  
12 137 overruns, the development of a “fool-proof” system in practice is extremely difficult.  
13

14 138 Likewise, Potts (2013)<sub>1</sub> believes developing and operating effective cost control is  
15  
16 139 challenging due to the unique nature of a project. Table 2 presents cost control  
17  
18 140 techniques, merits and demerits.  
19

20  
21  
22 141 Lewis (2007) believes that techniques are not the main factor in how effectively costs are  
23  
24 142 controlled, but the individuals within the business. He postulates further that the most  
25  
26 143 effective way to control a project's cost is for every person to control their own aspects,  
27  
28 144 emphasising the ‘human aspect’ to cost control.  
29

30  
31  
32 145 However, these factors reduce the influence that the cost consultants have on controlling  
33  
34 146 the costs. Potts (2013) cites research conducted in 1994 which found that traditionally, a  
35  
36 147 cost consultant would only monitor costs rather than control them. This would make the  
37  
38 148 role of a cost consultant in controlling costs, reactive rather than proactive.  
39

40  
41  
42 149  
43  
44 150 **Insert - Table 2.** Cost Control Techniques Description, Merits and Demerits  
45

46  
47 151  
48  
49  
50 152  
51  
52  
53 153 Digitisation has also played a role through advances in technology that has changed the  
54  
55 154 way cost control techniques are used. Planning and budgeting, resource scheduling<sub>1</sub> and  
56  
57 155 activity costing can all be done with software packages, making it easier than in the past  
58  
59 156 and tasks have become increasingly time-efficient (Webb, 2017). Jayaraman (2016)  
60

157 agrees to note that tracking and monitoring costs in fine detail has become possible and  
158 easier. They both also agree that although the monitoring and tracking have been made  
159 easier, the same attention to detail is needed.

160

### 161 **Selecting cost control techniques**

162 When selecting a cost control technique, the balance between the technique and the  
163 benefits it offers the project is important (Potts, 2013). Potts (2013) postulates that  
164 operating an extensive cost control system can become a “monster”, deflecting other  
165 important tasks a cost consultant has on a project. Sears (2015) agrees, stating that how  
166 costs are controlled on a project is dependent upon the “size and character” of the  
167 business. A smaller project would require a simple easy to follow cost control technique,  
168 whereas a complex project would require a more elaborate technique. This shows that the  
169 most effective technique could depend on the type of project it is applied to. A cost control  
170 technique needs to be an investment, not an expense, it has no value to the business if  
171 the data produced is not used or not reported in the relevant time frame (Sears, 2015).

172 According to Sears (2015), “the details of a specific cost control system vary substantially  
173 from one construction firm to another, the ensuring treatment can be regarded as being  
174 reasonably typical of current practice” (Sears, 2015). This statement indicates that even  
175 though the specific cost control techniques are different, the overall cost control method is  
176 relatively typical of those in similar businesses. Jayaraman (2016), mentioning  
177 standardisation of cost control is difficult, he believes there is no unanimity in the industry  
178 to which cost control technique is most effective and therefore should be utilised. Sears’  
179 (2015) believes that cost control systems of businesses are of the same nature could be  
180 sceptical as projects are unique and often have different demands meaning often different  
181 techniques are utilised. However, Bergerud (2012) disagrees, he concludes that

182 companies are standardising methods across their business but allowing for flexibility at  
183 the project level. Table 3 presents the important factors for selecting cost control  
184 techniques.

185

186 **Insert - Table 3.** Important factors when selecting cost control techniques

187

### 188 Research methodology

#### 189 Questionnaire survey

190 Selecting appropriate research methodology is vital in a study (Oyegoke, (2011; and  
191 (Sahu, (2013). This study relied on an extensive literature review to identify 35 cost  
192 overrun factors categorised into nine (9) broader themes, 10 cost control techniques, and  
193 6 factors for selecting appropriate cost control techniques which were used in the  
194 questionnaire survey. Prior to conducting the survey, a pilot survey was conducted  
195 among three participants who are working as cost consultants in the construction industry  
196 in the UK with 35, 10, and 1-years' experience. Naoum (2013) suggests that a pilot study  
197 provides a test run for the questions, which involves evaluation of the wording of the  
198 questions, identifying any ambiguous questions, testing the technique that the researchers  
199 use to collect the data. Based on Naoum (20123), the pilot survey was used to achieve  
200 two things; to ascertain that the local cost overrun control factors are not excluded and to  
201 prevent misunderstanding and ambiguities. Few issues that were raised in the pilot to  
202 improve the clarity of the question were addressed before questionnaires were rolled out.  
203 A non-random sampling technique – convenience samplings was used in the study. A  
204 convenience sample is a non-random sample containing individuals who can be accessed  
205 readily, where the researcher collects data from a conveniently available pool of  
206 respondents in a population who own qualities/experience that a researcher expects from

207 the target population (Fellows, 2015). The selected sample of participants consisted of  
208 professionals with extensive construction experience in the industry personally known to  
209 the researchers. The questionnaire used for the survey contained a five-point Likert scale  
210 under two main categories: ranking of the cost control techniques and Usage of cost  
211 control techniques. The questionnaire also included a few open-ended questions for  
212 participants to elaborate more on their responses. The questionnaires were emailed to 50  
213 Royal Institution of Chartered Surveyors (RICS) accredited cost consultant firms and, 30  
214 large-scale contracting firms in the UK selected by the researchers. Additional 20  
215 questionnaires were shared on LinkedIn with professionals with extensive construction  
216 experience in the industry known to the researchers. AOut of 100 questionnaires  
217 distributed, a total of 57 individuals completed the questionnaire accounting for a 57 per  
218 cent response rate. In addition to this, 3 respondents accepted a follow-up interview to  
219 further elaborate their answers and verify the results of the research.

## 220 Analysis of data

221 72% of participants work in the building industry, 19% in civil engineering, and 9% in other  
222 industries (e.g. local authority and wider client's organisations). 42% of participants work  
223 for contracting firms, 39% for consulting, 19% for the local authority. 49% of participants  
224 are quantity surveyors (cost consultants), 25% are project managers, 7% are company  
225 directors and 19% are others, which include; buildings surveyors, facilities managers,  
226 construction managers. 40% of participants have experience in £0-1 million projects, 30%  
227 with £1-10 million, 16% with £10-30 million, and 14% with £30+ million. On participants'  
228 years of experience, 22% have 0-5 years, 18% have 6-10, 18% have 11-20 and 42% have  
229 20+ years. This indicates that most participants have a wealth of experience that will  
230 enable them to give detailed insights into cost control techniques and cost overrun factors.

231 A five-point Likert scale ~~1-5~~ was used for ~~the~~ rating and the Relative Importance Index  
 232 (RII) method was used for the analysis of data: ranking the level of perceived importance  
 233 of the identified factors. This approach and the formula used in the analysis have been  
 234 previously used by Oyegoke and Kiyumi (2017), Muhwezietal (2014), and Khoshgoftar et  
 235 al. (2010), in their studies on ranking the most significant construction delay factors. The  
 236 purpose of this study was to identify and rank the most effective cost control techniques,  
 237 therefore, based on the previous studies, a five-point Likert scale and the Relative  
 238 Importance Index (RII) method and the formula (i) were deemed appropriate for the  
 239 analysis of data. Responses were assigned numerical values of 1 to 5 to the ratings as  
 240 follows: 'extremely important' = 5, 'important' = 4, 'neither important/unimportant' = 3,  
 241 'unimportant' = 2, 'extremely unimportant' = 1.

$$242 \text{ Relative Importance Index} = \frac{\sum W}{A \times N} \quad (0 \leq \text{RII} \leq 0.8) \quad (i)$$

244 Where:

245 W = the weight given to each factor by the respondents ranges from 1 to 5 (where "1" is

246 "lowest" and "5" is "highest");

247 A = highest weight which is 5 in this study; and

248 N = total number of respondents.

249 The relative range= 0.80.

250 The analysis was done and RII outputs were interpreted cautiously. After the ranking of 10  
 251 different cost control techniques and 6 cost control technique determining factors, the  
 252 researchers used thematic analysis which is an flexible analytic induction approach to  
 253 identify patterns through clustering to arrive at themes based on triangulated data from the  
 254 survey responses, follow-up interviews, and the literature review on cost overruns. An  
 255 analytic inductive approach allows research findings to emerge from the frequent,

256 dominant or significant themes inherent in raw data, without the restraints imposed by  
257 structured methodologies (Thomas, 2006). The approach adopted by the researchers  
258 followed the steps outlined by Braun and Clark (2006): 1. familiarisation with data, 2. the  
259 generation of initial codes, 3. search for themes among codes, 4. review of themes and the  
260 definition and naming of themes before the production of the final report. This thematic  
261 approach analysis started with identifying initial themes and concepts from literature on  
262 cost overruns and cost control techniques, continuously revising/developing the themes  
263 based on the survey responses and the follow-up interviews, and sorting the themes into  
264 broad categories. Subsequently, a simple but effective illustration (Figure 3) based on the  
265 themes identifying the challenges for monitoring and controlling costs, factors with  
266 significant impacts, and the most effective techniques was developed and validated using  
267 the follow-up interviews with 3 survey participants.

268

## 269 Findings and discussion of results

### 270 **Establishing the most effective cost control techniques**

271 The results of this study illustrate that the most effective cost control techniques are  
272 budgeting and cost forecasting. As shown in [Table 4](#), budgeting ranked first with 0.821 RII,  
273 followed by cost forecasting 0.800 RII and cashflow monitoring 0.733 RII. If successfully  
274 implemented and followed, budgeting will be effective in controlling costs as the cost will  
275 not overrun the budget (Kirkham, 2015). Participant three in the [follow-up](#) interview agrees  
276 with this point stating that if budgeting is undertaken correctly the project will not  
277 experience cost overruns. Cost forecasting gives [an](#) indication in advance of the expected  
278 costs. Identifying cost overruns early will allow for corrective action to be undertaken  
279 (Ashworth and Perera, 2015). Agreeing with Ashworth and Perera (2015), participant one

1  
2  
3 280 believes to effectively control costs, cost forecasting is the most effective as it allows for  
4  
5 281 early identification of cost overruns, allowing for controls to be put in place to mitigate  
6  
7 282 them. These techniques are cheap and simple to implement, which could be another  
8  
9  
10 283 explanation of why they are viewed as effective. Individuals will have experience utilising  
11  
12 284 them and will understand them clearly. The techniques being cheap to implement will  
13  
14  
15 285 enable them to be used on all projects as they will be cost-effective.

16  
17 286 The least used techniques are earned value ranked 10<sup>th</sup> with 0.579 RII, resources  
18  
19 287 monitoring 0.664 RII, interim valuation and payment 0.678 RII and value engineering  
20  
21 288 ranked 7<sup>th</sup> with 0.684 RII. As earned value is not a traditional technique, some participants  
22  
23  
24 289 may not have used it, therefore viewing it as ineffective. Participant two in the follow-up  
25  
26 290 interview solidified this point stating they have never used this technique, therefore, view it  
27  
28  
29 291 as the least effective. Additionally, as Webb (2017) states, this technique is more  
30  
31 292 complicated and involves advanced software, therefore becoming costlier and only  
32  
33 293 suitable for larger projects. Ranked the second least effective is monitoring labour,  
34  
35  
36 294 material, equipment, and overheads (costs). Potts (2013) postulates that only monitoring  
37  
38 295 costs is ineffective as once the costs have been incurred there is nothing the cost  
39  
40 296 consultants can do, indicating a lack of control. Participant one in the follow-up interview  
41  
42 297 agrees, expressing the usefulness of monitoring costs to understand the project's progress  
43  
44  
45 298 but the ineffectiveness of the technique in controlling costs.

46  
47  
48 299

49  
50  
51 300 **Insert - Table 4.** Ranking of the cost control techniques

52  
53 301

54  
55  
56 302 Figure 1 presents the usage of cost control techniques across different disciplines. In  
57  
58 303 consulting ranking, cost forecasting and budgeting top the list with 0.762 RII, followed by  
59  
60

304 variation/change management. the least ranked factors are: resources monitoring 0.524,  
305 earned value 0.552 RII, and interim valuation/payment 0.638 RII.

306 Budgeting also top in the contracting discipline with 0.861 RII, followed by cost forecasting  
307 0.843 RII and cashflow monitoring 0.791 RII. Budgeting also tops the local authority  
308 discipline with 0.836 followed by cost forecasting 0.818, cost reporting and cashflow  
309 monitoring 0.745 RII.

310

311 **Insert - Figure 1.** Usage of cost control techniques

312

313 The least rated are earned value 0.455 RII, value engineering 0.618, post-project review  
314 and site visits 0.691 RII.

315 Earned Value is lowest ranked in all the disciplines except under contracting with 0.655  
316 RII. As earned value is a technique used mainly by contractors (PMI, 2005), it is unlikely  
317 that other disciplines will have used it and therefore may not understand its effectiveness.

318 According to Webb (2017), earned value is not suitable for all project types, only projects  
319 with specific characteristics. Interim valuations and certificates for payments gains a low  
320 score across all projects illustrating that it is ineffective at controlling costs. Monitoring  
321 costs received a high rating on projects less than £10 million, however on projects over  
322 £10 million it is scored the lowest and second lowest, showing that on higher-value  
323 projects it is less effective. Therefore, on larger projects, more controls must be put in  
324 place to ensure the costs do not overrun, merely monitoring costs will not be enough.

325 On the different opinions relating to the experience of working on various project value  
326 ranges. Earned value is scored the lowest on £0-1 million and £1-10 million projects, and  
327 close to the lowest on £10-30 million and £30+ million projectss. This demonstrates that

1  
2  
3 328 earned value is viewed as the least effective, with it being more effective on larger projects  
4  
5  
6 329 than smaller projects. Similarly, [post](#)-project reviews and site meetings are viewed as more  
7  
8 330 effective on larger projects than smaller projects, suggesting that even though  
9  
10 331 collaboration and communication is important on all projects is it essential on larger  
11  
12 332 projects. The effectiveness of interim valuation and certificates for payment is consistently  
13  
14 333 scored lower as the projects increase in value, exemplifying the higher value the project,  
15  
16  
17 334 the less effective this technique. Using this technique on larger value projects may,  
18  
19 335 [therefore](#), be more of a hindrance than an advantage.

20  
21  
22 336 Figure 2 shows how insights differ depending on [an](#) individual's years of experience. Cost  
23  
24 337 forecasting is scored the highest for all experience levels except those with 20+ years.  
25  
26 338 Budgeting is scored the highest by those with 20+ years of experience and second by  
27  
28 339 those with less than 20 years of experience.

30  
31  
32 340

33  
34 341 **Insert - Figure 2.** Individual's Years of Experience Comparison

35  
36  
37 342

38  
39 343 This confirms that budgeting and cost forecasting are the most effective cost control  
40  
41 344 techniques. However, those with 20+ years of experience view variation/change  
42  
43 345 management as the second most effective technique. The opinion of those with 20+ years  
44  
45 346 of experience should be valued highly as they have used the techniques more therefore  
46  
47  
48 347 their judgement [was considered rational](#). Earned value is rated lower by those with more  
49  
50 348 than 11 years of experience but received higher scores by those with less experience.  
51  
52 349 Confirming that participants with more experience who use more traditional cost control  
53  
54  
55 350 techniques may not have experience with earned value, [therefore](#), view it as ineffective.

56  
57  
58 351 When asked if there are any techniques the participants found effective but were not in the  
59  
60 352 study, some different techniques were identified. Firstly, time management was listed,

1  
2  
3 353 having effective time management will be effective at controlling costs as any delays will  
4  
5 354 lead to cost overruns. Risk management was also identified as an effective technique.  
6  
7 355 Effectively managing risks is an important and effective technique, as common causes of  
8  
9 356 cost overruns have already been identified through risk management. Therefore, if these  
10  
11  
12 357 risks were successfully managed, [fewer](#) cost overruns would occur.

13  
14  
15 358 Finally, the technique that was identified multiple times was controlling the design.  
16  
17 359 Avoiding complex design, less design changes, and the design being as complete as  
18  
19 360 possible at the time of tender were all identified as ways to minimise cost overruns. As  
20  
21 361 design related factors have been established as the main cause of cost overruns,  
22  
23 362 controlling the design is essential to effectively control costs. However, at the [post](#)-contract  
24  
25 363 stage, little can be done if there is a complex design, therefore the cost consultants must  
26  
27 364 be involved in the design stage to give cost advice. More emphasis must be placed on  
28  
29 365 reducing design changes as these are the main factor causing cost overruns. As identified  
30  
31 366 by participants in this study, controls must be put in place to effectively manage the design  
32  
33 367 changes. Controlling design changes could be considered as one of the most effective  
34  
35 368 techniques [for](#) reducing cost overruns. However, changes in design are often out of the  
36  
37 369 cost consultants' control, therefore emphasis must be put on controlling the design  
38  
39 370 changes and managing them properly.

40  
41  
42  
43  
44  
45 371

46  
47  
48 372

### 49 373 **Selecting the most effective cost control technique**

50  
51 374 The overall result as in [Table 5](#) indicates that cost information/[cost](#)-related factors is  
52  
53 375 ranked first with 0.611 RII, followed by the size of company 0.509 RII and the effectiveness  
54  
55 376 of the technique 0.572 RII. The result for contracting discipline is similar except the third  
56  
57 377 factor are resources available and project duration 0.496. The consulting discipline sees

378 resources available, project duration and cost information/cost-related factors as equally  
379 important with 0.619 RII. Under local authority, the effectiveness of the technique ranked  
380 first 0.709 RII, followed by size of company 0.673 RII and cost information/cost related  
381 factors 0.600.

382 A main factor listed by participants on the reason why cost control should change due to  
383 project requirements was because of the unique nature of construction projects. With each  
384 project being different, techniques must be able to adapt to suit project requirements, this  
385 is consistent with Sears' (2015) point that projects are unique and have specific demands  
386 therefore different techniques are utilised. The size of a project, contract type and different  
387 requirements are all factors that mean cost control should be flexible across a company.  
388 Additionally, contractors or individuals may have their own techniques, therefore a  
389 company with many individuals working for them using different techniques.

390

391 **Insert - Table 5.** Selection of Cost Control Technique Factors

392

393

#### 394 **Standardisation of cost control**

395 The participants stated standardising cost control would allow for benchmarking and  
396 consistency. Standardising can improve accuracy as it allows for standards to be set.  
397 These results support Bergerud (2012) that there should be some standardisation of cost  
398 control across companies, but it should be flexible and be able to change due to a project's  
399 requirements. 28 per cent thinks that cost control should be standardised to maintain a  
400 consistent benchmark of cost and presentation to the client to set minimum standards. The  
401 respondents argued that it will improve accuracy, certainty, repetition of good practices,  
402 and avoid errors —. *“Standardisation makes it easier to establish control across the entire*

1  
2  
3 403 *company and projects can accurately be compared*“.\_–Another respondent stated “to  
4  
5 404 *support consistent and repeatable successful cost control utilising methods and reviews*  
6  
7 405 *that the team are comfortable with. Whilst utilising a standard approach there should be a*  
8  
9 406 *degree of tailoring to the project requirements around size, complexity, financial model,*  
10  
11 407 *etc.”*  
12  
13  
14

15 408 72 per cent thinks changes should be made due to project requirements. The resources  
16  
17 409 secured for the project, appropriateness of techniques, projects specific demands, project  
18  
19 410 peculiarities, resources availability, unforeseen circumstances, size of the contracting firm,  
20  
21 411 size and type of the project, and client-specific requirements are the reasons according to  
22  
23 412 the respondent to justify unstandardised approach to cost control. One of the respondents  
24  
25 413 states that “larger projects can benefit from more procedural cost control methods. Smaller  
26  
27 414 or fast projects may be hindered by cost control procedures. The uniqueness of each  
28  
29 415 project requires flexibility. Changes in the design and contract team for each project  
30  
31 416 requires re-thinking of approach each time. If a variable such as industry, client, laws and  
32  
33 417 regulations change then this may have an impact. Flexibility in contract and cost control  
34  
35 418 management is needed to meet changing situations.”  
36  
37  
38  
39  
40

41 419  
42  
43  
44 **420 Challenges for implementing effective cost control**  
45  
46 421 When asked about the main challenges faced when trying to monitor and control costs,  
47  
48 422 common themes highlighted are; information issues, client changes, and project  
49  
50 423 management issues. Distinctively the challenges faced in monitoring cost is different from  
51  
52 424 controlling cost. Similarly, design changes were identified as the main cause of cost  
53  
54 425 overruns, indicating that that client changes or design changes are a key issue in  
55  
56 426 implementing effective cost control. A simple solution to this would be to limit design  
57  
58 427 changes and ensure the client is happy with the design when the contract is awarded,  
59  
60

1  
2  
3 428 however, this is sometimes impossible as changes may be necessary. Project  
4  
5 429 management related factors featured more in the challenges of controlling costs, factors  
6  
7 430 such as lack of communication, lack of experience and poor planning represented some of  
8  
9 431 the main challenges of effective cost control. This demonstrates that when costs need to  
10  
11 432 be controlled rather than monitored, effective project management is essential. Ensuring  
12  
13 433 project members work collaboratively is essential in guaranteeing a project's success and  
14  
15 434 that the project does not experience cost overruns. If budgeting, forecasting and reporting  
16  
17 435 are completed more effectively, costs could be better controlled but to undertake these  
18  
19 436 methods correctly the cost consultant often must rely on the quality of information they  
20  
21  
22  
23  
24 437 receive, another challenge presented by the participants.  
25  
26

27 438

28  
29 439

#### 30 31 440 **The impact of digitisation on cost control**

32  
33 441 When asked if advances in technology have improved cost control, 84 per cent of  
34  
35 442 participants believed it has made controlling costs easier. Participants expressed how data  
36  
37 443 had become easier to collect, easier to store, and easier to analyse. Advances in  
38  
39 444 technology has allowed individuals to monitor costs more effectively and has made it more  
40  
41 445 time-efficient. It has allowed faster and better communication between parties, therefore  
42  
43 446 allowing for better collaboration and control. Measurement tools are also available,  
44  
45 447 allowing for more accurate and easier measurement. Tools presented by participants  
46  
47 448 included IT, Microsoft packages such as excel, Evolution M, online resources such as  
48  
49 449 Building Cost Information Service (BCIS) and software programs such as CCS WinQS,  
50  
51 450 CostX, Asta Power project, and EDMS. This indicates that there is a readily available  
52  
53  
54  
55 451 supply of technology that can enhance cost control, making it easier and more effective.  
56  
57  
58 452 However, 16% believed technology had not made cost control easier, one reason given for  
59  
60

453 this is tools are not being adopted widely enough. Nonetheless, with the majority of  
454 participants believing cost control is easier with advances in technology, it shows that  
455 technology is improving cost control.

456 Table 6 presents the challenges in monitoring and controlling costs. The thematic analysis  
457 described earlier was used to arrive at six themes.

458

459 **Insert - Table 6 Challenges** in monitoring and controlling costs

460

461 Figure 3 presents the summarised illustration of the key findings and themes. It shows the  
462 factors with significant impacts and challenges in monitoring and controlling cost and  
463 suggests some key elements in managing cost overrun.

464

465 **Insert - Figure 3 Managing** cost overrun in a project – controlling and monitoring

466

467 The illustration is based on the findings of the study and key determinant factors in  
468 selecting cost control techniques and the most appropriate techniques in different project  
469 types and sizes. The model was checked and verified using the follow-up interviews with 3  
470 survey participants from the industry. As illustrated in the diagram, cost overrun can be  
471 managed through clear scope definition, client direct involvement, preconstruction cost  
472 planning, completeness of design and application of appropriate cost control techniques.  
473 Three key determining factors for selecting cost control are identified: size in terms of  
474 project and company, appropriateness of the techniques and availability of cost  
475 information. Three most significant techniques were identified: budgeting, cost  
476 forecasting, and cash flow monitoring. Although this is a simplified representation of the

8 479 [control techniques in the construction industry.](#)

9  
10 480

11 481

## 12 482 **Conclusions**

13  
14  
15  
16  
17 483 It has been established that cost overruns occur on projects and there are effective cost  
18  
19  
20 484 control techniques that should be put in place. [Design management, a thorough cost](#)  
21  
22 485 [planning exercise, client's involvement and the use of digitisation can solve some of the](#)  
23  
24 486 [problems associated with design leading to additional cost. To minimise cost overruns](#)  
25  
26 487 [more accurate time and cost estimations must be produced and better coordination](#)  
27  
28 488 [between parties is needed.](#) If budgeting is done effectively and followed by the project  
29  
30  
31 489 team the cost of the project will come within budget. Cost forecasting is also an effective  
32  
33  
34 490 technique as it gives [an](#) early indication of costs therefore potential cost overruns can be  
35  
36 491 detected and controls can be put in place to minimise overruns. Variation/change  
37  
38 492 management is another simple and effective way to manage project costs to prevent  
39  
40 493 overrun. The use of different cost control techniques will depend on the different factors  
41  
42  
43 494 (project, size, time, etc.) as identified in the study. Therefore, selecting the most effective  
44  
45 495 cost control technique depends on the nature and size of the project, resources available,  
46  
47 496 and project duration.

48  
49  
50 497 Budgeting and cost forecasting are viewed as very effective and should always be utilised.

51  
52 498 Techniques such as earned value can only be used on specific projects and would not be

53  
54  
55 499 [cost-effective](#) on [lower](#)-value projects therefore would be ineffective on most projects. Due

56  
57 500 to the unique nature of construction projects, a company's cost control techniques should

58  
59 501 not be standardised and should be able to change due to project requirements. Advances

60

502 in technology have made controlling costs easier as data can now be collected, stored and  
503 analysed easier as well as making it more time-efficient and improving communication.

504 Building upon the scholarly works of Chan and Kumaraswamy (1997); Jackson (2002);  
505 Olawale and Sun (2010); Memon *et al.* (2011); Park and Papadopoulou (2012); Rosenfeld  
506 (2013), this study should be viewed as an extension of developing solutions for factors  
507 affecting the selection of effective cost control techniques in the UK construction industry.  
508 Although identifying and ranking the factors affecting the selection of effective cost control  
509 techniques in the UK construction industry has been the focal point of this study, clearly,  
510 further research is needed as this study is subject to a number of limitations. The study  
511 was only limited to the UK's construction industry and was based on a survey using the  
512 participants from the industry personally known to the researchers which may restrict the  
513 generalisability of its findings to be applied to other countries and specific project types. In  
514 addition to this, the effectiveness of these effective cost control techniques during the  
515 project execution phase needs to be thoroughly investigated in future research as it is  
516 evident that despite the use of cost control techniques many notable construction projects  
517 still experience cost overruns. Findings of this study and the proposed model, however,  
518 can be used as a learning tool for mitigating cost overruns and the effective use of cost  
519 control techniques in the construction industry.

Incompetent subcontractors	1,3,18,19	34. Love <i>et al.</i> (2004)
Insolvency	1,32	
Rework	1,33,34	
Inaccurate site investigations	3,16,31	
<b>Consultants specific factors</b>		
Unrealistic contract duration and requirements	1,16,19	
Commercial pressures	3,16,18	
Inaccurate quantities and omissions in the bills	2,16,34	
<b>Force majeure</b>		
Severe weather	1	
Unforeseen circumstances	1,2,3	

**Table 2** Cost control techniques description, merits and demerits

Technique	Description	Merits	Demerits	References
Earned Value	Mainly utilised by contractors to measure a project's progress by comparing the estimated cost against the actual cost at intervals throughout the project.	Indicate how the project is progressing and forecasting the total cost and time for the project; insight on problematic areas and their level of criticality and how to achieve progress.	Involves a lot of calculations and advanced software packages to collect and analyse the vast amount of data. Suitable for projects that have a structured plan of work, a cost structure and a suitable data collection system.	PMI (2005), Webb (2017)
Value Engineering	Part of the value management process used to identify and eliminate unnecessary cost, while providing the same quality and function.	It reduces unnecessary costs therefore providing value for money for the client and contractor. It is cheap to implement as the costs are often offset by the cost savings.	Often involve abortive actions therefore although saving money, quality can be comprised.	Cheah and Ting (2005), Ashworth & Perera (2015)
Monitoring project resources	Keeping check on costs incurred from labour, equipment and overheads.	Gives indication of the costs incurred compared to the budget. If over budget, it will give an understand of where the cost overruns are occurring.	It only monitors the costs, once the costs have been incurred, they cannot be controlled.	Day (1994), Kirkham (2015), Omotayo (2017)
Cashflow monitoring	To ensure money is available to meet outgoings and used by the contractor to calculate expenditure and income.	It gives indication if the project has slipped by comparing the current cash out flows against the estimated cash out flows. Early indication of cash expenditure and cash income therefore corrective action can be taken.	Merely monitoring cashflow is ineffective in controlling costs. It should be analysed and if needed, corrective action must be taken to ensure smooth running of the project.	Ashworth & Perera (2015), Kirkham (2015)
Cost forecasting	Estimating the future costs that are going to be incurred on the project. Separated into elements to understand where the expenditure is coming from.	Useful in identifying potential cost overruns to the budget. Identifying factors early can allow for corrective action to be taken.	Forecasts can often be inaccurate, unexpected events often occur in construction project making forecasting difficult.	Fellows (2008), Ashworth & Perera (2015), Omotayo (2017)

Budgeting	Involves estimating the costs and setting a fixed budget, which is used to compare expenditure against to understanding how the project is performing.	Gives indication of how the project is performing. Sets limits on cost expenditure, therefore if followed the project will remain in budget.	Rigorous budgeting can lead to quality being compromised; therefore, it is important to understand the client's objectives.	Kirkham (2015), Fellows (2008), Ashworth & Perera (2015)
Cost reporting	This includes expenditure, profit, total cost and forecasted final cost. Cost reports can be used by senior staff members to get an understanding of the project's progression.	Gives clear indication to all parties involved on how the project is performing.	Cost reporting does not assist in controlling cost, it simply gives an indication of how the project is progressing. Once the costs have been incurred, they cannot be controlled.	Kirkham (2015), Fellows (2008)
Variation/ change management	Alternation to the scope of works, this can be an addition, omission or substitution from the original scope of works in the construction contract.	Can lead to significant increases in costs. Managing variations effectively and spotting potential variations early will significantly reduce costs.	The design should be as complete as possible, and the contract should be adequate in describing all the works. More emphasis is put on the pre-contract works.	Oladapo (2007), Ashworth & Perera (2015)
Post project reviews and site meetings	The final meeting and progress meetings during the project. Cost, expenditure, profit and variations are discussed.	Extremely useful for reviewing a project's success and allows for a more experienced view on future projects. Useful for communication of potential cost overruns, allows for better communication between project members.	Meetings must be done regularly and should involve all project parties which can often be demanding which some may see as unnecessarily time consuming. Post project reviews will also be in effective at controlling the costs of the current project as it will be too late.	Omotayo (2017), Ashworth & Perera (2015)
Interim valuations and certificates	Valuing the work completed on site, agreeing the values between the client and contractors QS,	Allows payments to be made on the work completed.	Delays and variations could obstruct payments being made therefore creating financial difficulties.	RICS (2015), Ashworth & Perera (2015)

**Table 3** Important factors when selecting cost control techniques

Important factors	Reference No.	Sources
Size of Project	1,4,7	1.Oyegoke, A.S. (2006); 2. Flyvbjerg (2005); 3. Ashworth and Perera, S (2015); 4. Membah and Asa (2015); 5. Webb (2017), 6. Sun and Meng (2009); 7. Rostami and Oduoza (2017); 8. Kim <i>et al.</i> (2017).
